| Technical commentary        | <p>This slide is about Light Material Interaction 2/3. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Material properties determine weight of the individual effects / opaque colored material opaque black material / <math>A &gt; 0</math> , <math>T = 0</math> , <math>R &gt; 0</math> <math>A = I</math> , <math>T = 0</math> , <math>R = 0</math> / perfect mirror material transparent material / <math>A = 0</math> , <math>T = 0</math> , <math>R = I</math> <math>A \sim 0</math> , <math>R \sim 0</math> , <math>T \sim I</math>. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Source cue                  | - Light-material interaction described by the Spectral Response Function (SRF) / 400 Wavelength $\lambda$ (nm) 700 / ygrenE / 100% / All pass Filter ( ideal, real)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | <p>The slide 'Light Material Interaction 3/3' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Light-material interaction described by the Spectral Response Function (SRF) / 400 Wavelength <math>\lambda</math> (nm) 700 / ygrenE / 100% / All pass Filter ( ideal, real). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

| Technical commentary | This slide is about Light Material Interaction 3/3. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Light-material interaction described by the Spectral Response Function (SRF) / 400 Wavelength $\lambda$ (nm) 700 / ygrenE / 100% / All pass Filter ( ideal, real). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Light Material Interaction 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Source cue                  | - Light-material interaction results are the product of the SDF and SRF / 100% $\times$ 100% / SDF SRF / 0% 0% / 400 Wavelength $\lambda$ (nm) 700 400 Wavelength $\lambda$ (nm) 700                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | The slide 'Reflection = SDF x SRF' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Light-material interaction results are the product of the SDF and SRF / 100% $\times$ 100% / SDF SRF / 0% 0% / 400 Wavelength $\lambda$ (nm) 700 400 Wavelength $\lambda$ (nm) 700. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Reflection = SDF x SRF. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Light-material interaction results are the product of the SDF and SRF / 100% $\times$ 100% / SDF SRF / 0% 0% / 400 Wavelength $\lambda$ (nm) 700 400 Wavelength $\lambda$ (nm) 700. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Reflection Modeling 1/2' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - All light sources can be described by their Spectral Density Functions / - Natural light: sun, fire, ... / - Artificial light: light bulb, laser, neon tube, LED, ... / - All material properties can be described by Spectral Response Functions / - Glass, Water: SRF for transmission. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p> |
| Technical commentary        | <p>This slide is about Reflection Modeling 1/2. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - All light sources can be described by their Spectral Density Functions / - Natural light: sun, fire, ... / - Artificial light: light bulb, laser, neon tube, LED, ... / - All material properties can be described by Spectral Response Functions / - Glass, Water: SRF for transmission. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | <p>Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | <p>Can you name the geometric objects and attributes represented by 'Reflection Modeling 1/2' before rendering begins?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 32                     | Reflection Modeling 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Reflection Modeling 2/2' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Synthetic and natural objects are in general not self-emitting / - Light is reflected at its surfaces, i.e., re-emitted into the scene / - Reflection is dependent on surface properties / - Rough surface: scattering of light / - Smooth surface: reflection of light. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Reflection Modeling 2/2. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Synthetic and natural objects are in general not self-emitting / - Light is reflected at its surfaces, i.e., re-emitted into the scene / - Reflection is dependent on surface properties / - Rough surface: scattering of light / - Smooth surface: reflection of light. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Reflection Modeling 2/2' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide '8.4 Phong Illumination Model' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Determining the color of vertices. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about 8.4 Phong Illumination Model. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Determining the color of vertices. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to '8.4 Phong Illumination Model'?                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Page 34                     | Empirical Observations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | - Light reflections are / - Dependent on the position of the observer / "... position of the observer..." / - Dependent on the material properties of the surface / "... the specular properties of the object." Photo                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | The slide 'Empirical Observations' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Light reflections are / - Dependent on the position of the observer / "... position of the observer..." / - Dependent on the material properties of the surface / "... the specular properties of the object." Photo. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Empirical Observations. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Light reflections are / - Dependent on the position of the observer / "... position of the observer..." / - Dependent on the material properties of the surface / "... the specular properties of the object." Photo. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Empirical Observations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Illumination Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Illumination models calculate the color of scene objects / based on the following properties / - Location - Position <math>P = (x, y, z)</math> of the selected point <math>P</math> / - Orientation - normal direction <math>N = (n_x, n_y, n_z)</math> of surface in <math>P / x y z</math>. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p> |
| Technical commentary        | <p>This slide is about Illumination Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Illumination models calculate the color of scene objects / based on the following properties / - Location - Position <math>P = (x, y, z)</math> of the selected point <math>P</math> / - Orientation - normal direction <math>N = (n_x, n_y, n_z)</math> of surface in <math>P / x y z</math>. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | <p>Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'yaR' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: thgiL / Diffuse Intensity 1/3 / - Simulation of light reflections on diffuse surfaces / - Model assumption / - Diffuse light reflections are non-directional (scattering). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about yaR. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: thgiL / Diffuse Intensity 1/3 / - Simulation of light reflections on diffuse surfaces / - Model assumption / - Diffuse light reflections are non-directional (scattering). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'yaR'?                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Page 37                     | Diffuse Intensity 2/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Source cue                  | - Equation / $I = I_k \cdot n \cdot L \cdot \max(0, )$ / diffuse d d / - k diffuse material properties (surface dependent) / - L diffuse light intensity (light source dependent)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | The slide 'Diffuse Intensity 2/3' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Equation / $I = I_k \cdot n \cdot L \cdot \max(0, )$ / diffuse d d / - k diffuse material properties (surface dependent) / - L diffuse light intensity (light source dependent). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Diffuse Intensity 2/3. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Equation / $I = I_k \cdot n \cdot L \cdot \max(0, )$ / diffuse d d / - k diffuse material properties (surface dependent) / - L diffuse light intensity (light source dependent). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Diffuse Intensity 2/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|            |                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'Diffuse Intensity 3/3' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: $I = k \cdot L \cdot \max(0, \mathbf{l} \cdot \mathbf{n}) / \text{diffuse } d$ / <a href="https://bit.ly/2XFhbcM">https://bit.ly/2XFhbcM</a> / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                           |
| Technical commentary        | This slide is about Diffuse Intensity 3/3. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: $I = k \cdot L \cdot \max(0, \mathbf{l} \cdot \mathbf{n}) / \text{diffuse } d$ / <a href="https://bit.ly/2XFhbcM">https://bit.ly/2XFhbcM</a> / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you turn 'Diffuse Intensity 3/3' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 39                     | Ambient Intensity 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source cue                  | - Simulation of the general room brightness / - Indirect light incidence or multiple reflections / - Model assumptions / - Constant influence on all scene objects / - No influence of position or alignment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | The slide 'Ambient Intensity 1/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Simulation of the general room brightness / - Indirect light incidence or multiple reflections / - Model assumptions / - Constant influence on all scene objects / - No influence of position or alignment. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Ambient Intensity 1/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Simulation of the general room brightness / - Indirect light incidence or multiple reflections / - Model assumptions / - Constant influence on all scene objects / - No influence of position or alignment. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Ambient Intensity 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 40                     | Ambient Intensity 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Ambient Intensity 2/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: $I = k \cdot L / \text{ambient } a$ / <a href="https://bit.ly/2XGn61n">https://bit.ly/2XGn61n</a> / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                                                         |
| Technical commentary        | This slide is about Ambient Intensity 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: $I = k \cdot L / \text{ambient } a$ / <a href="https://bit.ly/2XGn61n">https://bit.ly/2XGn61n</a> / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Ambient Intensity 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 41                     | Specular Intensity 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Specular Intensity 1/3' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Simulation of light reflections on specular surfaces / - Model assumption / - Reflection of light are directed (reflection) / - Observations / - Reflections of light are observer-dependent. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Technical commentary | This slide is about Specular Intensity 1/3. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Simulation of light reflections on specular surfaces / - Model assumption / - Reflection of light are directed (reflection) / - Observations / - Reflections of light are observer-dependent. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Page 42                     | Reflection Vector $\mathbf{r}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | - Calculation of the reflection vector / - Incidence angle corresponds to exit angle / - Equation / $\mathbf{r} = 2\mathbf{n} \cdot \mathbf{n} \cdot \mathbf{l} - \mathbf{l}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'Reflection Vector $\mathbf{r}$ ' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Calculation of the reflection vector / - Incidence angle corresponds to exit angle / - Equation / $\mathbf{r} = 2\mathbf{n} \cdot \mathbf{n} \cdot \mathbf{l} - \mathbf{l}$ . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Reflection Vector $\mathbf{r}$ . The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Calculation of the reflection vector / - Incidence angle corresponds to exit angle / - Equation / $\mathbf{r} = 2\mathbf{n} \cdot \mathbf{n} \cdot \mathbf{l} - \mathbf{l}$ . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you turn 'Reflection Vector $\mathbf{r}$ ' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|            |                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Specular Intensity 2/3' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Equation $I = k_r \mathbf{n} \cdot \mathbf{v} + k_s L \cdot \max(0, \mathbf{n} \cdot \mathbf{l})^p$ / specular s s / - k specular material properties (surface dependant) / - L specular light intensity (light source dependent). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Specular Intensity 2/3. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Equation $I = k_r \mathbf{n} \cdot \mathbf{v} + k_s L \cdot \max(0, \mathbf{n} \cdot \mathbf{l})^p$ / specular s s / - k specular material properties (surface dependant) / - L specular light intensity (light source dependent). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Page 44                     | Specular Exponent p                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | - p influences fall off of specular highlight ( $p \in [1, M]$ mit $M \approx 100$ ) / $p = 1 / \max(0, \mathbf{n} \cdot \mathbf{v})$ / $p = 5 / \max(0, \mathbf{n} \cdot \mathbf{v})^5$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Specular Exponent p' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - p influences fall off of specular highlight ( $p \in [1, M]$ mit $M \approx 100$ ) / $p = 1 / \max(0, \mathbf{n} \cdot \mathbf{v})$ / $p = 5 / \max(0, \mathbf{n} \cdot \mathbf{v})^5$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.                                              |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Technical commentary | This slide is about Specular Exponent $p$ . The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - $p$ influences fall off of specular highlight ( $p \in [1, M]$ mit $M \approx 100$ ) / $p = 1 / \max(0, \mathbf{r} \cdot \mathbf{v})$ $1 / p = 5 / \max(0, \mathbf{r} \cdot \mathbf{v})^5$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Specular Exponent $p$ '?                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Specular Intensity 3/3' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: $\mathbf{r} = 2 \cdot \mathbf{n} \cdot \mathbf{n} \cdot \mathbf{l} - \mathbf{l}$ / <a href="https://bit.ly/2XbPc7s">https://bit.ly/2XbPc7s</a> $I = k \cdot L \cdot \max(0, \mathbf{r} \cdot \mathbf{v})^p$ / specular $s s$ / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Specular Intensity 3/3. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: $\mathbf{r} = 2 \cdot \mathbf{n} \cdot \mathbf{n} \cdot \mathbf{l} - \mathbf{l}$ / <a href="https://bit.ly/2XbPc7s">https://bit.ly/2XbPc7s</a> $I = k \cdot L \cdot \max(0, \mathbf{r} \cdot \mathbf{v})^p$ / specular $s s$ / Extrahierte Tabellen: / [Tabelle 1]. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you turn 'Specular Intensity 3/3' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|            |                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide 'Blinn-Phong Illumination Model 1/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Alternative simulation of specular reflections / - Replace mirror direction <math>r</math> with Halfway-Vector <math>h</math> / - <math>h = l + v</math> / - <math>h</math> is halfway between <math>l</math> and <math>v</math> / - Equation. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Blinn-Phong Illumination Model 1/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Alternative simulation of specular reflections / - Replace mirror direction <math>r</math> with Halfway-Vector <math>h</math> / - <math>h = l + v</math> / - <math>h</math> is halfway between <math>l</math> and <math>v</math> / - Equation. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | <p>Can you identify the normal, light vector, view vector, and material term relevant to 'Blinn-Phong Illumination Model 1/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 47                     | Blinn-Phong Illumination Model 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | <p>The slide 'Blinn-Phong Illumination Model 2/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: <math>h = l + v</math> / <a href="https://bit.ly/2ICDwBD">https://bit.ly/2ICDwBD</a> <math>I = k \cdot L \cdot \max(0, h \cdot n)^p</math> / specular <math>s</math> <math>s</math> / Extrahierte Tabellen: / [Tabelle 1]. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p>                       |

| Technical commentary | This slide is about Blinn-Phong Illumination Model 2/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: $h = \frac{l + v}{2}$ / <a href="https://bit.ly/2ICDwBD">https://bit.ly/2ICDwBD</a> $I = k \cdot L \cdot \max(0, h \cdot n)^p$ / specular $s \cdot s$ / Extrahierte Tabellen: / [Tabelle 1]. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Blinn-Phong Illumination Model 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Phong Illumination Model' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Additive combination of all factors / $I = k \cdot L$ / ambient $a \cdot a$ / $I = k \cdot L \cdot \max(0, n \cdot l)$ / diffuse $d \cdot d$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Phong Illumination Model. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Additive combination of all factors / $I = k \cdot L$ / ambient $a \cdot a$ / $I = k \cdot L \cdot \max(0, n \cdot l)$ / diffuse $d \cdot d$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Phong Illumination Model' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Additive combination of all factors $I = k \cdot L / \text{ambient } a / I = k \cdot L \cdot \max(0, n \cdot l) / \text{diffuse } d$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Phong Illumination Model. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Additive combination of all factors $I = k \cdot L / \text{ambient } a / I = k \cdot L \cdot \max(0, n \cdot l) / \text{diffuse } d$ . Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Phong Illumination Model'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Source cue                  | Coloring triangles when using vertex-based illumination                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | The slide '8.5 Shading' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: Coloring triangles when using vertex-based illumination. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about 8.5 Shading. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: Coloring triangles when using vertex-based illumination. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Shading' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Illumination model usually applied in the fragment stage / - Vertex-based illumination also possible to save compute / - Requires to spread the illumination information of the vertices / over the triangle / Flat Gouroud Phong. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Shading. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Illumination model usually applied in the fragment stage / - Vertex-based illumination also possible to save compute / - Requires to spread the illumination information of the vertices / over the triangle / Flat Gouroud Phong. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you explain which samples/fragments are generated by 'Shading'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 52                     | Shading Computation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Shading Computation' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Tasks of shading procedures / - Colorize surfaces based on colors calculated by illumination model / - Shading is closely linked to the rasterization process and integrated into it / - Distribute lighting and shading / - Calculate light intensity for surface points. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about Shading Computation. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Tasks of shading procedures / - Colorize surfaces based on colors calculated by illumination model / - Shading is closely linked to the rasterization process and integrated into it / - Distribute lighting and shading / - Calculate light intensity for surface points. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | <p>Can you explain which samples/fragments are generated by 'Shading Computation'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Flat Shading' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Operation / - Calling the lighting model for a single point of a surface / (e.g., polygon center) / - Shading of the entire polygon in the determined intensity / - Useful if the following assumptions apply. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Technical commentary | This slide is about Flat Shading. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Operation / - Calling the lighting model for a single point of a surface / (e.g., polygon center) / - Shading of the entire polygon in the determined intensity / - Useful if the following assumptions apply. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Gouraud Shading 1/5' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Shading method for polygons based on the interpolation / of intensity values at the polygon vertices / - Requirements / - Area decomposition in polygons (usually triangles) / - Normals for polygon corners (vertex normals). A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Gouraud Shading 1/5. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Shading method for polygons based on the interpolation / of intensity values at the polygon vertices / - Requirements / - Area decomposition in polygons (usually triangles) / - Normals for polygon corners (vertex normals). A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you explain which samples/fragments are generated by 'Gouraud Shading 1/5'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Gouraud Shading 2/5' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Proceeding / - Compute intensity values $I$ for polygon corners $v_i$ / - Linear interpolation of the intensity values along the edges / - Linear interpolation of the intensity values along the scanlines. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Gouraud Shading 2/5. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Proceeding / - Compute intensity values $I$ for polygon corners $v_i$ / - Linear interpolation of the intensity values along the edges / - Linear interpolation of the intensity values along the scanlines. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you explain which samples/fragments are generated by 'Gouraud Shading 2/5'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 56                     | Gouraud Shading 3/5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Gouraud Shading 3/5' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Shading at conceptually smooth transitions / - Geometrically "hard" edges instead of conceptually "soft" edges / - Gouraud shading can create visually smooth transitions / through smooth shading / - Example: P / P smooth transition, P / P hard transition. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Gouraud Shading 3/5. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Shading at conceptually smooth transitions / - Geometrically "hard" edges instead of conceptually "soft" edges / - Gouraud shading can create visually smooth transitions / through smooth shading / - Example: P / P smooth transition, P / P hard transition. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Gouraud Shading 4/5' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - interpolation problems / - The shading inside a triangle results from interpolation / - Intensity fluctuations in the interior are not taken into account / - Intensity fluctuations can only be considered by finer tessellation / - Example: Spotlight shines into the interior of a triangle. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about Gouraud Shading 4/5. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - interpolation problems / - The shading inside a triangle results from interpolation / - Intensity fluctuations in the interior are not taken into account / - Intensity fluctuations can only be considered by finer tessellation / - Example: Spotlight shines into the interior of a triangle. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | <p>Can you explain which samples/fragments are generated by 'Gouraud Shading 4/5'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'Gouraud Shading 5/5' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Interpolation problems / - Contiguous polygons that do not fully share the same edges / will be shaded differently. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p>                                                                                                                                                                                         |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Technical commentary | This slide is about Gouraud Shading 5/5. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Interpolation problems / - Contiguous polygons that do not fully share the same edges / will be shaded differently. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Gouraud Shading 5/5'?                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Phong Shading 1/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Interpolation of the corner normals instead of the corner intensities / - Proceeding / - Calculation of the corner normals / - Interpolation of the normals between the corners / - Interpolation between the endpoints of a scanline. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Phong Shading 1/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Interpolation of the corner normals instead of the corner intensities / - Proceeding / - Calculation of the corner normals / - Interpolation of the normals between the corners / - Interpolation between the endpoints of a scanline. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you explain which samples/fragments are generated by 'Phong Shading 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 60                     | Phong Shading 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Phong Shading 2/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Advantages / - Pixel-based (i.e., image-precise) evaluation of the light sources / - Highly focused highlights at corners are not interpolated over the edge / - Highlights inside a triangle can be displayed / - Disadvantage. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Phong Shading 2/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Advantages / - Pixel-based (i.e., image-precise) evaluation of the light sources / - Highly focused highlights at corners are not interpolated over the edge / - Highlights inside a triangle can be displayed / - Disadvantage. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you explain which samples/fragments are generated by 'Phong Shading 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Technical commentary | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. |
| Why it matters       | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you identify which source or topic 'Literature and other sources used in this chapter' points to for deeper study?                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Lesen und Ausprobieren' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Zum Lesen - Zum Ausprobieren / Marschner, Steve und Peter Shirley: / - Simulation von drei / Fundamentals of Computer Graphics, / ausgewählten Materialien. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Lesen und Ausprobieren. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Zum Lesen - Zum Ausprobieren / Marschner, Steve und Peter Shirley: / - Simulation von drei / Fundamentals of Computer Graphics, / ausgewählten Materialien. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Lesen und Ausprobieren'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## 08.1 Physics of Light

Source location: Section 8.1

### Commentary

The physics slides provide intuition for light as energy interacting with surfaces. For this course, the goal is not full physical simulation but a usable model for real-time rendering.

Important terms are reflection, absorption, wavelength/color, intensity, and direction. These terms become shader inputs or material parameters later. The simplified model must still preserve the relation between light direction, surface orientation, and observed brightness.

## **Mental model**

Shading is an approximation of light-surface interaction that is cheap enough for rendering.

## **Check yourself**

Why does surface orientation affect diffuse brightness?

# **08.2 Light Sources**

Source location: Section 8.2

## **Commentary**

Light source models define where light comes from and how its direction and intensity are computed. Directional lights approximate distant sources with parallel rays. Point lights emit from a position and often include attenuation. Spotlights add a directional cone.

In shader code, the type of light determines how you compute the light vector. A directional light can use a fixed direction; a point light requires subtracting the surface position from the light position.

## **Mental model**

Different light types mainly change how the light direction and intensity are computed at the surface point.

## **Check yourself**

What is the difference between a directional light vector and a point light vector?

# **08.3 Material Models**

Source location: Section 8.3

## **Commentary**

A material model tells the shader how a surface responds to light. Diffuse material scatters light broadly; specular material creates view-dependent highlights; ambient terms approximate background illumination.

Material coefficients are not arbitrary decoration. They scale the contribution of each lighting term. If the specular coefficient is zero, the surface should not show a specular highlight under that model.

## **Mental model**

Light asks what arrives; material answers how the surface reacts.

## **Check yourself**

Which material parameter would you adjust to reduce shiny highlights?

## 08.4 Phong Illumination Model

Source location: Section 8.4

### Commentary

The Phong illumination model combines ambient, diffuse, and specular terms. Diffuse lighting uses the angle between normal and light direction. Specular lighting also depends on the viewer because highlights move with the view direction.

The formula is less important than the decomposition. Ambient is a rough constant approximation. Diffuse is orientation-dependent matte reflection. Specular is view-dependent shininess. A correct answer should name the vectors and normalize them.

### Mental model

Phong-style lighting is a sum of simple terms, each modeling a different visual effect.

### Check yourself

Why does the specular term depend on the view direction?

## 08.5 Shading

Source location: Section 8.5

### Commentary

Shading decides where the illumination calculation is evaluated and how results are interpolated. Flat shading uses one value per primitive. Gouraud shading evaluates at vertices and interpolates colors. Phong shading interpolates normals and evaluates lighting per fragment.

Per-fragment shading is more expensive but can represent highlights more accurately. This connects directly to the pipeline: interpolation during rasterization provides the data used by the fragment shader.

### Mental model

The shading method decides what is computed at vertices and what is computed at fragments.

### Check yourself

Why can Gouraud shading miss a small specular highlight?

## End-of-lecture summary

If you remember only one thing from Lecture 08, remember this: This lecture explains how visible surface points receive color from local light, material, normal, and view information. It is about shading a point, not solving all global light transport.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.

# Lecture 09 - Texturing

This lecture treats textures as sampled data for shading, not merely images glued onto objects. It connects UV coordinates, sampling, filtering, mipmaps, OpenGL texture state, and advanced texture uses.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Page 1                      | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 2                      | Textures: Sampled Data for Shading                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Textures: Sampled Data for Shading' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Textures are sampled data fields used during rendering / ■ Most common case: 2D image data mapped onto 3D geometry / ■ Texture values can represent color, transparency, normals, roughness, height, masks, or arbitrary / lookup data. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Textures: Sampled Data for Shading. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Textures are sampled data fields used during rendering / ■ Most common case: 2D image data mapped onto 3D geometry / ■ Texture values can represent color, transparency, normals, roughness, height, masks, or arbitrary / lookup data. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | <p>No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | <p>The slide 'Texturing Example' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p> |
| Technical commentary        | <p>This slide is about Texturing Example. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.</p>                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Texturing Example' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Texture Mapping' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Texture mapping / • Application of texture defined in multidimensional texture space to object defined in 3D space / • Realized through per-fragment operations / • A texture lookup turns texture coordinates into data used by the shader. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Texture Mapping. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Texture mapping / • Application of texture defined in multidimensional texture space to object defined in 3D space / • Realized through per-fragment operations / • A texture lookup turns texture coordinates into data used by the shader. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Texture Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 5                      | Why Textures Matter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Why Textures Matter' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Geometry defines shape / ■ Textures define appearance detail / ■ This separates visual complexity from geometric complexity / ■ Instead of modeling every scratch, brick, pore, label, or color variation, we store it in texture data / ■ Textures are efficient. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |
| Technical commentary        | <p>This slide is about Why Textures Matter. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Geometry defines shape / ■ Textures define appearance detail / ■ This separates visual complexity from geometric complexity / ■ Instead of modeling every scratch, brick, pore, label, or color variation, we store it in texture data / ■ Textures are efficient. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | <p>Texture sampling is a major source of visual detail and a common source of artifacts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | <p>Can you identify the sampled data, coordinate, and filtering/state issue in 'Why Textures Matter'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 6                      | Textures Are More Than Color Images                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Textures Are More Than Color Images' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Modern rendering usually uses several texture maps per object / ■ Each map controls one part of the material or shading model / ■ Textures are therefore general-purpose GPU data sources / ■ Common texture maps / • Base color / albedo. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Textures Are More Than Color Images. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Modern rendering usually uses several texture maps per object / ■ Each map controls one part of the material or shading model / ■ Textures are therefore general-purpose GPU data sources / ■ Common texture maps / • Base color / albedo. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Texturing Demo' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Preset Plain Object / Rotate / Base color / albedo / Normal / Roughness. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |

| Technical commentary | This slide is about Texturing Demo. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Preset Plain Object / Rotate / Base color / albedo / Normal / Roughness. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                       |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Texturing Demo'?                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Overview' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: 9.1 Texture Objects, Texels, Formats, and Color Space / 9.2 Texture Coordinates, UV Mapping, and Wrapping / 9.3 Sampling, Filtering, Mipmaps, and Anisotropy / 9.4 Modern OpenGL Texture Pipeline / 9.5 Normal Mapping. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Overview. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: 9.1 Texture Objects, Texels, Formats, and Color Space / 9.2 Texture Coordinates, UV Mapping, and Wrapping / 9.3 Sampling, Filtering, Mipmaps, and Anisotropy / 9.4 Modern OpenGL Texture Pipeline / 9.5 Normal Mapping. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Overview'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide '9.1 Texture Objects, Texels, Formats, and Color Space' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: What texture data stores and how the GPU interprets it. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p>                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'From Image File to GPU Texture Object' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Texture data starts as image file or generated array / ■ During loading, data is uploaded to GPU memory / ■ On the GPU, data becomes a texture object / ■ The shader accesses it through a sampler / ■ Pipeline. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |

| Technical commentary | This slide is about From Image File to GPU Texture Object. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Texture data starts as image file or generated array / ■ During loading, data is uploaded to GPU memory / ■ On the GPU, data becomes a texture object / ■ The shader accesses it through a sampler / ■ Pipeline. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'From Image File to GPU Texture Object'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Texels, Channels, and Meaning' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Texel: smallest sample element of a texture / ■ In 2D, a texel is analogous to a pixel / ■ Texels store numeric channel values / ■ Common channel layouts / • R, RG, RGB, RGBA. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Texels, Channels, and Meaning. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Texel: smallest sample element of a texture / ■ In 2D, a texel is analogous to a pixel / ■ Texels store numeric channel values / ■ Common channel layouts / • R, RG, RGB, RGBA. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Texels, Channels, and Meaning'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 12                     | Texture Targets and Dimensionality                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Texture Targets and Dimensionality' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>■ Texture target describes the sampled data domain</li> <li>■ Different targets use different coordinate types</li> <li>■ 1D texture</li> <li>• Coordinate</li> <li>• Lookup tables or transfer functions.</li> </ul> <p>Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Texture Targets and Dimensionality. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>■ Texture target describes the sampled data domain</li> <li>■ Different targets use different coordinate types</li> <li>■ 1D texture</li> <li>• Coordinate</li> <li>• Lookup tables or transfer functions.</li> </ul> <p>Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you state the coordinate space before and after 'Texture Targets and Dimensionality'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Internal Texture Formats' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Internal format defines GPU texel storage / ■ It specifies channels, precision, and representation / ■ Examples / • GL_R8: one 8-bit normalized channel / • GL_RGBA8: four 8-bit normalized channels. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Internal Texture Formats. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Internal format defines GPU texel storage / ■ It specifies channels, precision, and representation / ■ Examples / • GL_R8: one 8-bit normalized channel / • GL_RGBA8: four 8-bit normalized channels. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Numeric Texture Representations' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Texel values can be interpreted differently / ■ Normalized integer formats / • Stored as integers / • Sampled as normalized floats / 255 → 1.0. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p>                                                |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Color Textures vs. Data Textures' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Some textures store perceptual color / ■ Other textures store numeric shader data / ■ Color textures / • Base color / albedo / • Emissive color. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Color Textures vs. Data Textures. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Some textures store perceptual color / ■ Other textures store numeric shader data / ■ Color textures / • Base color / albedo / • Emissive color. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Color Textures vs. Data Textures'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide '2D Texture Access' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ For each fragment, texturecoordinates are interpolated / ■ During texture access texel values are bilinearly interpolated. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about 2D Texture Access. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ For each fragment, texturecoordinates are interpolated / ■ During texture access texel values are bilinearly interpolated. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | <p>Can you state the coordinate space before and after '2D Texture Access'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Bilinear Interpolation' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Example: linear interpolation in 2D (=bilinear) / <math>f = f(s, t)</math> / ■ Interpolation requires three computations ( Notation: <math>ij\ ij\ ij</math> ) / <math>s-s / f = (1 - \alpha) \cdot f + \alpha \cdot f\ \alpha =</math>. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                              |
| Technical commentary        | <p>This slide is about Bilinear Interpolation. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Example: linear interpolation in 2D (=bilinear) / <math>f = f(s, t)</math> / ■ Interpolation requires three computations ( Notation: <math>ij\ ij\ ij</math> ) / <math>s-s / f = (1 - \alpha) \cdot f + \alpha \cdot f\ \alpha =</math>. The slide groups them because one object or quantity is processed into another result used later in rendering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Bilinear Interpolation' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 18                     | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                                                                                                                                                             |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 19                     | Texture Memory Footprint                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Texture Memory Footprint' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: ■ Texture memory depends on resolution and format / $\text{memory} = \text{width} \cdot \text{height} \cdot \text{bytes per texel}$ / ■ Example memory costs / • RGBA8: 4 MiB / • RGBA8: 16 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Technical commentary | This slide is about Texture Memory Footprint. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: ■ Texture memory depends on resolution and format / $\text{memory} = \text{width} \cdot \text{height} \cdot \text{bytes per texel}$ / ■ Example memory costs / • RGBA8: 4 MiB / • RGBA8: 16 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. |
| Why it matters       | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you compute or explain the pixel count, color depth, or memory relation in 'Texture Memory Footprint'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Texture Compression and Asset Pipelines' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ File formats and GPU formats are different concepts / ■ File formats / • PNG, JPEG, OpenEXR / • Used for storage and authoring / ■ GPU formats. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Texture Compression and Asset Pipelines. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ File formats and GPU formats are different concepts / ■ File formats / • PNG, JPEG, OpenEXR / • Used for storage and authoring / ■ GPU formats. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Texture Compression and Asset Pipelines'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 21                     | Steps Involved in Texturing                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Steps Involved in Texturing' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Provide textures (e.g., load from file) / ■ Configure texture mapping(e.g., border handling, texture coordinates, texture filtering) / ■ Rendering / • Fetch texture values (usually by exploiting interpolation) / • Modify fragment color based on fetched texel value. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Steps Involved in Texturing. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Provide textures (e.g., load from file) / ■ Configure texture mapping(e.g., border handling, texture coordinates, texture filtering) / ■ Rendering / • Fetch texture values (usually by exploiting interpolation) / • Modify fragment color based on fetched texel value. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide '9.2 Texture Coordinates, UV Mapping, and Wrapping' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Aligning texture space with geometry. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                                                                                             |
| Technical commentary        | This slide is about 9.2 Texture Coordinates, UV Mapping, and Wrapping. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Aligning texture space with geometry. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you state the coordinate space before and after '9.2 Texture Coordinates, UV Mapping, and Wrapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Texture Coordinate System 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Object space: 3D vertices in model coordinate system / (x, y, z) / • Coordinate representation: / ■ Texture space: 1D, 2D, 3D space of texture data / (s, t, r, q). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

| Technical commentary | This slide is about Texture Coordinate System 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Object space: 3D vertices in model coordinate system / $(x, y, z)$ / • Coordinate representation: / ■ Texture space: 1D, 2D, 3D space of texture data / $(s, t, r, q)$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you state the coordinate space before and after 'Texture Coordinate System 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Texture Coordinate System 2/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: $[0, 1]^2$ / ■ Texture coordinate system normalized to for 2D textures (analog for 1D and 3D textures) / $s, t, r, q$ $s, t, r, q \in [0, 1]$ / • Coordinate axes denoted by with / $(s)$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Texture Coordinate System 2/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $[0, 1]^2$ / ■ Texture coordinate system normalized to for 2D textures (analog for 1D and 3D textures) / $s, t, r, q$ $s, t, r, q \in [0, 1]$ / • Coordinate axes denoted by with / $(s)$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you state the coordinate space before and after 'Texture Coordinate System 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Texture Coordinate Specification' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ 2D texturing / <math>p = (x, y, z)</math> <math>p = (s, t)</math> / • For every vertex <math>g</math> of a polygon, texture coordinates <math>t</math> are specified / • Texture coordinates <math>t</math> are obtained from parametrization algorithms / • Texture coordinates <math>t</math> are linearly interpolated over a polygon (analogous to Gouraud shading). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Texture Coordinate Specification. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ 2D texturing / <math>p = (x, y, z)</math> <math>p = (s, t)</math> / • For every vertex <math>g</math> of a polygon, texture coordinates <math>t</math> are specified / • Texture coordinates <math>t</math> are obtained from parametrization algorithms / • Texture coordinates <math>t</math> are linearly interpolated over a polygon (analogous to Gouraud shading). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | <p>Can you state the coordinate space before and after 'Texture Coordinate Specification'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Disc Parametrization' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: $r \text{ xy} / \blacksquare \text{ Circular disc with radius } r, \text{ centered in the plane } / p = (x, y, z) = (a \cdot \cos(\theta), a \cdot \sin(\theta), 0) \theta \in [0, 2\pi] a \in [0, r] / \bullet g \text{ with and } / p = (s, t) \in [0, 1]^2 s = \theta t = a$ . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Disc Parametrization. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: $r \text{ xy} / \blacksquare \text{ Circular disc with radius } r, \text{ centered in the plane } / p = (x, y, z) = (a \cdot \cos(\theta), a \cdot \sin(\theta), 0) \theta \in [0, 2\pi] a \in [0, r] / \bullet g \text{ with and } / p = (s, t) \in [0, 1]^2 s = \theta t = a$ . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Disc Parametrization' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Cylinder Parametrization' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: $xy \text{ r} = 1 \text{ h z} / \blacksquare \text{ Cylinder based in plane with radius and height along axis (surface is topologically / two-dimensional and overlap-free) } / p = (x, y, z) = (r \cdot \cos(\theta), r \cdot \sin(\theta), z) \theta \in [0, 2\pi] z \in [0, h] / \bullet g \text{ with and}$ . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Cylinder Parametrization. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: $xy \text{ r} = 1 \text{ h z} / \blacksquare \text{ Cylinder based in plane with radius and height along axis (surface is topologically / two-dimensional and overlap-free) } / p = (x, y, z) = (r \cdot \cos(\theta), r \cdot \sin(\theta), z) \theta \in [0, 2\pi] z \in [0, h] / \bullet g \text{ with and}$ . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you turn 'Cylinder Parametrization' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Page 28                     | Two-Part Mapping 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Two-Part Mapping 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Texture coordinates for complex geometries are derived from intermediate objects (i.e., geometries / with inherent parametrization) / ■ Proceeding / • Calculate texture coordinates for intermediate object / <math>p = (x, y, z)</math> <math>p = (s, t)</math> <math>p</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Two-Part Mapping 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Texture coordinates for complex geometries are derived from intermediate objects (i.e., geometries / with inherent parametrization) / ■ Proceeding / • Calculate texture coordinates for intermediate object / <math>p = (x, y, z)</math> <math>p = (s, t)</math> <math>p</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you state the coordinate space before and after 'Two-Part Mapping 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 29                     | Two-Part Mapping 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Two-Part Mapping 2/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Two-part mapping has no restrictions wrt. objects to be textured / ■ Intermediate object must be appropriate for object to be textured. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p>                                                        |
| Technical commentary        | <p>This slide is about Two-Part Mapping 2/2. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Two-part mapping has no restrictions wrt. objects to be textured / ■ Intermediate object must be appropriate for object to be textured. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | <p>Texture sampling is a major source of visual detail and a common source of artifacts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Two-Part Mapping Example' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Object: non-convex polyhedron / ■ Intermediate object: cylinder / • 1 : Cast rays from object center through vertices to intersect cylinder (projection) / • 2 : Cylinder parametrization / <math>F(p) = F(F(p)) = (s, t)</math>. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary | This slide is about Two-Part Mapping Example. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Object: non-convex polyhedron / ■ Intermediate object: cylinder / • 1 : Cast rays from object center through vertices to intersect cylinder (projection) / • 2 : Cylinder parametrization / $F(p) = F(F(p)) = (s, t)$ . Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself       | Can you decide whether 'Two-Part Mapping Example' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Source cue                  | O O / ■ G center through vertices to I / O O / ■ G along normal to I / O O                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'Projection Calculation Variations' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: O O / ■ G center through vertices to I / O O / ■ G along normal to I / O O. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection Calculation Variations. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: O O / ■ G center through vertices to I / O O / ■ G along normal to I / O O. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you explain how 'Projection Calculation Variations' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|            |                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Texture Coordinate Transformation' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Texture coordinates can be transformed through transformation matrix / • No restriction regarding matrix coefficients (4x4 matrix) / ■ Applications / • Shifting texture coordinates / • Scaling texture coordinates. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Texture Coordinate Transformation. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Texture coordinates can be transformed through transformation matrix / • No restriction regarding matrix coefficients (4x4 matrix) / ■ Applications / • Shifting texture coordinates / • Scaling texture coordinates. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you state the coordinate space before and after 'Texture Coordinate Transformation'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | Stage Transformed Texture / scaleS 1 / scaleT 1 / offsetS 0 / offsetT 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Professor-style explanation | The slide 'Demo - Texture Coordinate Transformation' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Stage Transformed Texture / scaleS 1 / scaleT 1 / offsetS 0 / offsetT 0. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

| Source cue                  | ■ Height field represented as triangular mesh / (x, y) (s, t) / • Use normalized coordinates as texture coordinates (can be used to map aerial / image) / z r                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Height Field Texturing Example' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Height field represented as triangular mesh / (x, y) (s, t) / • Use normalized coordinates as texture coordinates (can be used to map aerial / image) / z r. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

| Professor-style explanation | The slide '9.3 Sampling, Filtering, Mipmaps, and Anisotropy' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: Reconstructing texture values under magnification and minification. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about 9.3 Sampling, Filtering, Mipmaps, and Anisotropy. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: Reconstructing texture values under magnification and minification. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in '9.3 Sampling, Filtering, Mipmaps, and Anisotropy'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Forward vs. Inverse Mapping' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Forward mapping - from texture to screen space / • Object's surface parameterization / • Projection transformation / ■ Inverse mapping - from screen to texture space / • Find corresponding pre-image/footprint of each pixel in texture. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |

| Technical commentary | This slide is about Forward vs. Inverse Mapping. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Forward mapping - from texture to screen space / • Object's surface parameterization / • Projection transformation / ■ Inverse mapping - from screen to texture space / • Find corresponding pre-image/footprint of each pixel in texture. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you state the coordinate space before and after 'Forward vs. Inverse Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Forward Mapping' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Maps each texel to screen space / • Uniform sampling of texture does not guarantee uniform sampling in screen space / ■ Forward mapping used for following cases / • Texture-to-screen mapping difficult to invert / • Texture image does not fit into memory. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Forward Mapping. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Maps each texel to screen space / • Uniform sampling of texture does not guarantee uniform sampling in screen space / ■ Forward mapping used for following cases / • Texture-to-screen mapping difficult to invert / • Texture image does not fit into memory. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Forward Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Inverse Mapping 1/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ For each pixel pre-image in texture space is found and its area is integrated over / ■ Inverse mapping can be used when / • Texture image fits into memory / • Forward mapping can be inverted / 1 for y in range(height): # screen 'height'. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |

The terms describe sampled data access: ■ For each pixel pre-image in texture space is found and its area is integrated over / ■ Inverse mapping can be used when / • Texture image fits into memory / • Forward mapping can be inverted / 1 for y in range(height): # screen 'height'. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Inverse Mapping 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Inverse Mapping 2/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Pre-image of square screen pixel intersecting curved surface is curvilinear quadrilateral in texture / space / ■ Curvilinear quadrilateral often approximated / • By general quadrilateral / • By parallelogram. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Inverse Mapping 2/2. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Pre-image of square screen pixel intersecting curved surface is curvilinear quadrilateral in texture / space / ■ Curvilinear quadrilateral often approximated / • By general quadrilateral / • By parallelogram. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Magnification vs. Minification' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Magnification / • Map few texels onto many pixels / • Two filtering approaches / • Nearest: Take the nearest texel / • Bilinear interpolation: Interpolation between 4 nearest texels. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |

| Technical commentary | This slide is about Magnification vs. Minification. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Magnification / • Map few texels onto many pixels / • Two filtering approaches / • Nearest: Take the nearest texel / • Bilinear interpolation: Interpolation between 4 nearest texels. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. |
| Why it matters       | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself       | Can you identify the sampled data, coordinate, and filtering/state issue in 'Magnification vs. Minification'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Nearest vs. Linear Interpolation' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Nearest neighbor interpolation / (s, t) / • For coordinates select nearest integer texel / (int(round(s · texdim )), int(round(t · texdim ))) / x y. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Nearest vs. Linear Interpolation. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Nearest neighbor interpolation / (s, t) / • For coordinates select nearest integer texel / (int(round(s · texdim )), int(round(t · texdim ))) / x y. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'Minification Filtering Requirements' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Preimage integration with insufficient filtering results in aliasing / artifacts. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.                            |
| Technical commentary        | This slide is about Minification Filtering Requirements. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Preimage integration with insufficient filtering results in aliasing / artifacts. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Minification Filtering Requirements'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Demo - Magnification Filtering: Nearest vs Linear' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: Stage Split Comparison / magFilter GL_NEAREST / zoom 12 / textureResolution 8x8 / showTexelGrid. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |

| Professor-style explanation | <p>The slide 'MIP Mapping (multum in parvo = 'much in little')' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access:</p> <ul style="list-style-type: none"> <li>■ Efficient scheme for sampling texture values / ■ Representation of a texture at different resolution levels(levels of Detail, LoDs) / ■ Exploiting a texture pyramid (here: 2D, analog for 1D and 3D) / • Each pyramid level contains filtered textureof half resolution of previous level / • Each layer contains only quarter of texelsof previous layer. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</li> </ul> |
| Technical commentary        | This slide is about MIP Mapping (multum in parvo = 'much in little'). The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Efficient scheme for sampling texture values / ■ Representation of a texture at different resolution levels(levels of Detail, LoDs) / ■ Exploiting a texture pyramid (here: 2D, analog for 1D and 3D) / • Each pyramid level contains filtered textureof half resolution of previous level / • Each layer contains only quarter of texelsof previous layer. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'MIP Map Pyramid 1/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ MIP Map-Level 0 : Texture in original size / $2N-1$ / ■ MIP Map-Level 1: Texture size / ■ ... / $N/20$ . Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about MIP Map Pyramid 1/2. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ MIP Map-Level 0 : Texture in original size / $2N-1$ / ■ MIP Map-Level 1: Texture size / ■ ... / $N/20$ . Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'MIP Map Pyramid 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | ■ Example MIP Map / ■ Self-Contained MIP Map for efficient storage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'MIP Map Pyramid 2/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Example MIP Map / ■ Self-Contained MIP Map for efficient storage. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary        | This slide is about MIP Map Pyramid 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Example MIP Map / ■ Self-Contained MIP Map for efficient storage. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you turn 'MIP Map Pyramid 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Source cue                  | ■ 33% more memory is needed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide 'MIP Mapping Memory' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: ■ 33% more memory is needed. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations. |
| Technical commentary        | This slide is about MIP Mapping Memory. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: ■ 33% more memory is needed. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'MIP Mapping Procedure' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: <math>\lambda \in [0, N]</math> / ■ Selection of the resolution levels based on continuous LoD level for a given fragment / ■ Procedure / • LoD level calculation / • Intra-level interpolation: interpolation within two levels closest to. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                                                                                     |
| Technical commentary        | <p>This slide is about MIP Mapping Procedure. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: <math>\lambda \in [0, N]</math> / ■ Selection of the resolution levels based on continuous LoD level for a given fragment / ■ Procedure / • LoD level calculation / • Intra-level interpolation: interpolation within two levels closest to. The slide groups them because one object or quantity is processed into another result used later in rendering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | <p>Even a sparse slide usually names a relation you must be able to explain in words.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | <p>Can you turn 'MIP Mapping Procedure' into a causal sentence instead of repeating the slide title?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 49                     | LoD Calculation 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'LoD Calculation 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Assumptions / <math>[0, 1]^2</math> / • 2D texture is parametrized with texture coordinates / <math>M \cdot M = 2N</math> / • 2D texture has texels with (power-of-two texture). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about LoD Calculation 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Assumptions / $[0, 1]^2$ / • 2D texture is parametrized with texture coordinates / $M \times M = 2^N$ / • 2D texture has texels with (power-of-two texture). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself       | Can you state the coordinate space before and after 'LoD Calculation 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Source cue                  | ■ Approximation of the preimage by square / ■ Calculation of the MIP map level / • Area of approximating square is / $b = A$ / • Length of square's side is                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'LoD Calculation 2/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Approximation of the preimage by square / ■ Calculation of the MIP map level / • Area of approximating square is / $b = A$ / • Length of square's side is. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about LoD Calculation 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Approximation of the preimage by square / ■ Calculation of the MIP map level / • Area of approximating square is / $b = A$ / • Length of square's side is. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you turn 'LoD Calculation 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Demo - Minification, Mipmaps, and Mipmap Level Visualization' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: Stage Minified Floor / minFilter GL_LINEAR_MIPMAP_LINEAR / mipmapsEnabled / lodBias 0 / visualizeMipLevels. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Demo - Minification, Mipmaps, and Mipmap Level Visualization. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: Stage Minified Floor / minFilter GL_LINEAR_MIPMAP_LINEAR / mipmapsEnabled / lodBias 0 / visualizeMipLevels. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Demo - Minification, Mipmaps, and Mipmap Level Visualization'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Page 52                     | Anisotropic Filtering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Anisotropic Filtering' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Approximation of preimage through several squares. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.                                                                                               |
| Technical commentary        | This slide is about Anisotropic Filtering. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Approximation of preimage through several squares. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Anisotropic Filtering'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | Stage 1x vs Selected Anisotropy / anisotropy 16x / minFilter GL_LINEAR_MIPMAP_LINEAR / textureFrequency 34 / cameraAngle 10                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | <p>The slide 'Demo - Anisotropic Filtering' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: Stage 1x vs Selected Anisotropy / anisotropy 16x / minFilter GL_LINEAR_MIPMAP_LINEAR / textureFrequency 34 / cameraAngle 10. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Demo - Anisotropic Filtering. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: Stage 1x vs Selected Anisotropy / anisotropy 16x / minFilter GL_LINEAR_MIPMAP_LINEAR / textureFrequency 34 / cameraAngle 10. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you explain how 'Demo - Anisotropic Filtering' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide '9.4 Modern OpenGL Texture Pipeline' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Texture objects, sampler uniforms, and shader-based access. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.                                                                                    |
| Technical commentary        | This slide is about 9.4 Modern OpenGL Texture Pipeline. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Texture objects, sampler uniforms, and shader-based access. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'OpenGL Texturing' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Texturing procedure / • Fetch interpolated texel value from texture / • Use texel value to modulate fragment color or depth / ■ Configuration / • Per texture. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Technical commentary | This slide is about OpenGL Texturing. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Texturing procedure / • Fetch interpolated texel value from texture / • Use texel value to modulate fragment color or depth / ■ Configuration / • Per texture. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'OpenGL Minification & Magnification 1/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ OpenGL exposes two texture filtering parameters: / • GL_TEXTURE_MIN_FILTER / • GL_TEXTURE_MAG_FILTER / ■ Texture minification (GL_TEXTURE_MIN_FILTER) options / • GL_NEAREST - nearest neighbor interpolation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Minification & Magnification 1/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ OpenGL exposes two texture filtering parameters: / • GL_TEXTURE_MIN_FILTER / • GL_TEXTURE_MAG_FILTER / ■ Texture minification (GL_TEXTURE_MIN_FILTER) options / • GL_NEAREST - nearest neighbor interpolation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Minification & Magnification 1/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | ■ OpenGL bilinear filtering example / 1 glEnable(GL_TEXTURE_2D); / 2 glGenTextures(1, &textureID); / 3 glBindTexture(GL_TEXTURE_2D, textureID); / 4 ...                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Professor-style explanation | The slide 'OpenGL Minification & Magnification 2/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ OpenGL bilinear filtering example / 1 glEnable(GL_TEXTURE_2D); / 2 glGenTextures(1, &textureID); / 3 glBindTexture(GL_TEXTURE_2D, textureID); / 4 . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Minification & Magnification 2/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ OpenGL bilinear filtering example / 1 glEnable(GL_TEXTURE_2D); / 2 glGenTextures(1, &textureID); / 3 glBindTexture(GL_TEXTURE_2D, textureID); / 4 . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Minification & Magnification 2/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 58                     | OpenGL Minification & Magnification 3/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'OpenGL Minification &amp; Magnification 3/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ OpenGL mipmapping example / 1 glEnable(GL_TEXTURE_2D); / 2 glGenTextures(1, &amp;textureID); / 3 glBindTexture(GL_TEXTURE_2D, textureID); / 4 . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about OpenGL Minification &amp; Magnification 3/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ OpenGL mipmapping example / 1 glEnable(GL_TEXTURE_2D); / 2 glGenTextures(1, &amp;textureID); / 3 glBindTexture(GL_TEXTURE_2D, textureID); / 4 . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Minification &amp; Magnification 3/3'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide 'Demo - Texture Units and Sampler Uniforms' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: Stage Combined Sampling / textureUnit0 Checker / textureUnit1 Brick / textureUnit2 UV Test / baseSamplerUnit 0. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |

| Technical commentary | This slide is about Demo - Texture Units and Sampler Uniforms. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: Stage Combined Sampling / textureUnit0 Checker / textureUnit1 Brick / textureUnit2 UV Test / baseSamplerUnit 0. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. |
| Why it matters       | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself       | Can you identify the sampled data, coordinate, and filtering/state issue in 'Demo - Texture Units and Sampler Uniforms'?                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Texture Wrapping 1/4' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs:</p> <p>■ Texture wrapping specifies border handling behavior when accessing texture outside the / [0, 1]D / normalized texture value range /</p> <p>■ Texture wrapping mode is part of texture specification, and specified separately for each texture / dimension. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Texture Wrapping 1/4. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs:</p> <p>■ Texture wrapping specifies border handling behavior when accessing texture outside the / [0, 1]D / normalized texture value range /</p> <p>■ Texture wrapping mode is part of texture specification, and specified separately for each texture / dimension. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Texture Wrapping 2/4' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ GL_CLAMP_TO_EDGE / • Texture coordinates below 0 become 0 / • Texture coordinates above 1 become 1 / • Results in constant continuation of texture / ■ GL_CLAMP_TO_BORDER. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Texture Wrapping 2/4. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ GL_CLAMP_TO_EDGE / • Texture coordinates below 0 become 0 / • Texture coordinates above 1 become 1 / • Results in constant continuation of texture / ■ GL_CLAMP_TO_BORDER. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | <p>Can you state the coordinate space before and after 'Texture Wrapping 2/4'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 62                     | Texture Wrapping 3/4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Texture Wrapping 3/4' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ GL_REPEAT / • Texture coordinates ignore digits before decimal point, and use digits after decimal point as / texture coordinates / • Results in periodic continuation of normalized texture space / ■ GL_MIRRORED_REPEAT. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Texture Wrapping 3/4. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ GL_REPEAT / • Texture coordinates ignore digits before decimal point, and use digits after decimal point as / texture coordinates / • Results in periodic continuation of normalized texture space / ■ GL_MIRRORED_REPEAT. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | <p>Can you state the coordinate space before and after 'Texture Wrapping 3/4'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Texture Wrapping 4/4' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ OpenGL code snippets / 1 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_S, GL_MIRRORED_REPEAT);</code> / 2 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_T, GL_MIRRORED_REPEAT);</code> / 1 <code>const GLfloat borderColor[] = { 1.0f, 1.0f, 0.0f, 1.0f };</code> / 3 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_S, GL_CLAMP_TO_BORDER)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Texture Wrapping 4/4. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ OpenGL code snippets / 1 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_S, GL_MIRRORED_REPEAT);</code> / 2 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_T, GL_MIRRORED_REPEAT);</code> / 1 <code>const GLfloat borderColor[] = { 1.0f, 1.0f, 0.0f, 1.0f };</code> / 3 <code>glTextureParameteri(textureID, GL_TEXTURE_WRAP_S, GL_CLAMP_TO_BORDER)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide 'Texel Value Usage' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Older OpenGL versions support several modes for modulating fragment colors by texel colors / (today still relevant to reimplement in shader) - is current fragment with calculated color values / C A T C A / F and alpha values F - is current texture with color values T and alpha values T (or / L C A C. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Texel Value Usage. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Older OpenGL versions support several modes for modulating fragment colors by texel colors / (today still relevant to reimplement in shader) - is current fragment with calculated color values / C A T C A / F and alpha values F - is current texture with color values T and alpha values T (or / L C A C. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Texel Value Usage'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'Texturing in GLSL Shaders 1/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Textures are bound to texture units / ■ Sampler uniforms select the texture unit used by the shader / 1 glBindTextureUnit(0, texture2D); / 2 glBindTextureUnit(1, texture3D); / 4 glUseProgram(p). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Texturing in GLSL Shaders 1/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Textures are bound to texture units / ■ Sampler uniforms select the texture unit used by the shader / 1 glBindTextureUnit(0, texture2D); / 2 glBindTextureUnit(1, texture3D); / 4 glUseProgram(p). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Texturing in GLSL Shaders 1/3'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide 'Texturing in GLSL Shaders 2/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Vertex Shader / 1 layout(location = 0) in vec3 position; / 2 layout(location = 1) in vec3 texCoord; / 4 out vec3 vTexCoord; / 6 uniform mat4 modelViewProjectionMatrix. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Texturing in GLSL Shaders 2/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Vertex Shader / 1 layout(location = 0) in vec3 position; / 2 layout(location = 1) in vec3 texCoord; / 4 out vec3 vTexCoord; / 6 uniform mat4 modelViewProjectionMatrix. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide 'Texturing in GLSL Shaders 3/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Fragment Shader / 1 in vec3 vTexCoord; / 3 out vec4 fragmentColor; / 5 uniform sampler2D texture2D_; / 6 uniform sampler3D texture3D_. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Technical commentary | This slide is about Texturing in GLSL Shaders 3/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Fragment Shader / 1 in vec3 vTexCoord; / 3 out vec4 fragmentColor; / 5 uniform sampler2D texture2D_; / 6 uniform sampler3D texture3D_. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Texturing in GLSL Shaders 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Page 68                     | 9.5 Normal Mapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | Encoding surface detail in texture space                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Professor-style explanation | The slide '9.5 Normal Mapping' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Encoding surface detail in texture space. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about 9.5 Normal Mapping. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Encoding surface detail in texture space. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to '9.5 Normal Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Motivation' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: ■ Render content dichotomy / • Shape: Triangles are used to generate geometric details / k k k / • Appearance: Textures are used to generate material variations ( a , d , s ) / ■ Consequences. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about Motivation. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: ■ Render content dichotomy / • Shape: Triangles are used to generate geometric details / k k k / • Appearance: Textures are used to generate material variations ( a , d , s ) / ■ Consequences. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | <p>Can you explain which samples/fragments are generated by 'Motivation'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 70                     | <p>Mesh Compression</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Source cue                  | <p>[source]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | <p>The slide 'Mesh Compression' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: [source]. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Technical commentary        | <p>This slide is about Mesh Compression. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: [source]. The slide groups them because one object or quantity is processed into another result used later in rendering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | <p>Even a sparse slide usually names a relation you must be able to explain in words.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | <p>Can you turn 'Mesh Compression' into a causal sentence instead of repeating the slide title?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Normal Mapping 1/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Breaks dichotomy by representing geometric details in textures, as texels represent variations in / surface normals / ■ Normal maps accompany diffuse maps with same resolution Material details and geometric / details match. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Normal Mapping 1/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Breaks dichotomy by representing geometric details in textures, as texels represent variations in / surface normals / ■ Normal maps accompany diffuse maps with same resolution Material details and geometric / details match. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Normal Mapping 2/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: <math>k_n</math> / <math>k_s</math> During illumination computation <math>d</math> is fetched from the diffuse map, while <math>n</math> is fetched from the normal map / <math>I = k_a + k_d \frac{1 + \max(0, n \cdot l)}{2} + k_s \frac{1 + \max(0, v \cdot r)}{2}</math> <math>p/a</math> Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Normal Mapping 2/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: <math>k_n</math> / <math>k_s</math> During illumination computation <math>d</math> is fetched from the diffuse map, while <math>n</math> is fetched from the normal map / <math>I = k_a + k_d \frac{1 + \max(0, n \cdot l)}{2} + k_s \frac{1 + \max(0, v \cdot r)}{2}</math> <math>p/a</math> Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you identify the normal, light vector, view vector, and material term relevant to 'Normal Mapping 2/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 73                     | Normal Maps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Normal Maps' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Normal vector components can be positive or negative Components need to be normalized to <math>[-1, 1]</math> / before storage, and rescaled to after texture fetch / <math>n' := (n) + 0.5</math> / Before storage. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p>                                                                               |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary | This slide is about Normal Maps. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: $\mathbf{n}$ Normal vector components can be positive or negative Components need to be normalized to $[0, 1]$ $[-1, 1]$ / before storage, and rescaled to after texture fetch $n' := (n + 0.5)$ / Before storage. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Normal Maps'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Tangent Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: $\mathbf{n}$ Normal Map vectors align along axis and need to be transformed into view coordinate system / before illumination computation / $\mathbf{t}$ Tangent coordinate system spanned by $\mathbf{t}$ / $\mathbf{s}$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Tangent Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $\mathbf{n}$ Normal Map vectors align along axis and need to be transformed into view coordinate system / before illumination computation / $\mathbf{t}$ Tangent coordinate system spanned by $\mathbf{t}$ / $\mathbf{s}$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you state the coordinate space before and after 'Tangent Space'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'TBN Matrix' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ TBN matrix (Tangent, Bitangent, and Normal) is an orthonormal matrix, which transforms tangent / space normal to view space normal / ■ TBN matrix construction (similar to camera transformation) / • TBN matrix contains three perpendicular vectors / • First column vector: tangent. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about TBN Matrix. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ TBN matrix (Tangent, Bitangent, and Normal) is an orthonormal matrix, which transforms tangent / space normal to view space normal / ■ TBN matrix construction (similar to camera transformation) / • TBN matrix contains three perpendicular vectors / • First column vector: tangent. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | <p>Can you state the coordinate space before and after 'TBN Matrix'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | <p>No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | <p>The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Technical commentary | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Page 77                     | Tangent Vector Derivation 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Source cue                  | ■ ■ / t b / Observation: triangle edges can be expressed based on basis given by and / ■ ■ / e ■ = $\Delta u \cdot t + \Delta v \cdot b$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Tangent Vector Derivation 1/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: ■ ■ / t b / Observation: triangle edges can be expressed based on basis given by and / ■ ■ / e ■ = $\Delta u \cdot t + \Delta v \cdot b$ . A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Tangent Vector Derivation 1/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: ■ ■ / t b / Observation: triangle edges can be expressed based on basis given by and / ■ ■ / e ■ = $\Delta u \cdot t + \Delta v \cdot b$ . A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you explain which samples/fragments are generated by 'Tangent Vector Derivation 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Tangent Vector Derivation 2/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ ■ / t b / We can solve this matrix for and / t t t Δu Δv e e e / x y z 0 0 0x 0y 0z. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Tangent Vector Derivation 2/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ ■ / t b / We can solve this matrix for and / t t t Δu Δv e e e / x y z 0 0 0x 0y 0z. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you state the coordinate space before and after 'Tangent Vector Derivation 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Page 80                     | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                      |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 81                     | Observations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | ■ ■ ■ ■ / t b n $\Rightarrow$ t b / and are perpendicular to each other as well as to t only one, or , needs to be / computed, while the other can be derived through cross product / ■ ■                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Observations' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ ■ ■ ■ / t b n $\Rightarrow$ t b / and are perpendicular to each other as well as to t only one, or , needs to be / computed, while the other can be derived through cross product / ■ ■. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Observations. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ ■ ■ ■ / t b n $\Rightarrow$ t b / and are perpendicular to each other as well as to t only one, or , needs to be / computed, while the other can be derived through cross product / ■ ■. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Variations' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Different variations of normal maps exist / • Bump maps - specify displacement of surface points in normal direction / Vector offset bump maps - offset vector added to normal / • Vector rotation bump maps - normal rotated given angle. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Variations. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Different variations of normal maps exist / • Bump maps - specify displacement of surface points in normal direction / Vector offset bump maps - offset vector added to normal / • Vector rotation bump maps - normal rotated given angle. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Variations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide '9.6 Environment Mapping' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Sampling directional environment data for reflections and lighting. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about 9.6 Environment Mapping. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Sampling directional environment data for reflections and lighting. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to '9.6 Environment Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Environment Mapping Motivation' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: <ul style="list-style-type: none"> <li>■ Many reflective and glossy materials show light from their surroundings</li> <li>/ ■ Explicitly tracing all reflection rays is expensive in interactive rendering</li> <li>/ ■ Environment maps provide a compact representation of incident radiance</li> <li>/ ■ Typical use cases / • mirror-like reflections.</li> </ul> Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Technical commentary | This slide is about Environment Mapping Motivation. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Many reflective and glossy materials show light from their surroundings / ■ Explicitly tracing all reflection rays is expensive in interactive rendering / ■ Environment maps provide a compact representation of incident radiance / ■ Typical use cases / • mirror-like reflections. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself       | Can you decide whether 'Environment Mapping Motivation' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Environment Mapping Process' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Environment mapping simulates reflections by sampling an image of the surrounding scene / ■ The environment is treated as if it were infinitely far away / ■ The reflected view direction determines which part of the environment is visible / [Need for Speed no Limits]. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Environment Mapping Process. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Environment mapping simulates reflections by sampling an image of the surrounding scene / ■ The environment is treated as if it were infinitely far away / ■ The reflected view direction determines which part of the environment is visible / [Need for Speed no Limits]. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Environment Mapping Process'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Environment Mapping Assumptions' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ The environment is assumed to be far away / • translation of the object does not change the sampled environment / ■ The reflected object does not reflect itself / ■ Nearby dynamic objects are usually missing / ■ The approximation works best for. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |
| Technical commentary        | <p>This slide is about Environment Mapping Assumptions. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ The environment is assumed to be far away / • translation of the object does not change the sampled environment / ■ The reflected object does not reflect itself / ■ Nearby dynamic objects are usually missing / ■ The approximation works best for. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Environment Mapping Assumptions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 87                     | Environment Mapping 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | <p>The slide 'Environment Mapping 2/2' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: <math>V \cdot N</math> / ■ At the shaded surface point, the view vector is reflected about the normal / ■ The resulting reflection vector is used to access the environment map / ■ is calculated analog to the Phong illumination model <math>R = 2 \cdot (V \cdot N) \cdot N - V</math>. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Environment Mapping 2/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: <math>V \cdot N</math> / ■ At the shaded surface point, the view vector is reflected about the normal / ■ The resulting reflection vector is used to access the environment map / ■ is calculated analog to the Phong illumination model <math>R = 2 \cdot (V \cdot N) \cdot N - V</math>. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Demo - Cube-map Reflection Vector' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: Stage Reflection Vector / object Sphere / showSkybox / reflectionMode Reflection / reflectivity 1. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p> |
| Technical commentary        | <p>This slide is about Demo - Cube-map Reflection Vector. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: Stage Reflection Vector / object Sphere / showSkybox / reflectionMode Reflection / reflectivity 1. The slide groups them because one object or quantity is processed into another result used later in rendering.</p>                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you turn 'Demo - Cube-map Reflection Vector' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Environment Mapping Types 1/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Different parameterizations store directional data in different ways / ■ They differ with respect to / • distortion / • filtering behavior / • hardware support. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |
| Technical commentary        | <p>This slide is about Environment Mapping Types 1/2. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Different parameterizations store directional data in different ways / ■ They differ with respect to / • distortion / • filtering behavior / • hardware support. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Environment Mapping Types 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Environment Mapping Types 2/2' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Spherical environment maps / • compact representation in one 2D texture / • strong distortion near the border / • difficult filtering and interpolation behavior / ■ Dual-paraboloid maps. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Environment Mapping Types 2/2. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Spherical environment maps / • compact representation in one 2D texture / • strong distortion near the border / • difficult filtering and interpolation behavior / ■ Dual-paraboloid maps. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Environment Mapping Types 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Page 91                     | Spherical Mapping 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Spherical Mapping 1/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Spherical Mapping 1/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Check yourself              | Can you turn 'Spherical Mapping 1/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 92                     | Spherical Mapping 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Spherical Mapping 2/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Technical commentary        | This slide is about Spherical Mapping 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Spherical Mapping 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 93                     | Spherical Environment Mapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | ■ A sphere map stores the environment as seen in a perfectly reflective sphere / ■ It was useful before cube maps became widely supported in graphics hardware / ■ It is mainly relevant today as historical context / ■ Important limitations / • non-uniform distortion                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'Spherical Environment Mapping' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ A sphere map stores the environment as seen in a perfectly reflective sphere / ■ It was useful before cube maps became widely supported in graphics hardware / ■ It is mainly relevant today as historical context / ■ Important limitations / • non-uniform distortion. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Technical commentary | This slide is about Spherical Environment Mapping. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ A sphere map stores the environment as seen in a perfectly reflective sphere / ■ It was useful before cube maps became widely supported in graphics hardware / ■ It is mainly relevant today as historical context / ■ Important limitations / • non-uniform distortion. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. |
| Why it matters       | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you identify the sampled data, coordinate, and filtering/state issue in 'Spherical Environment Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Sphere Map Distortion' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Sphere-map texels represent differently sized regions of the environment / ■ Distortion is especially problematic in the outer region of the map / ■ Hardware performs linear texture filtering, not spherical interpolation / ■ For modern real-time graphics, this is one reason cube maps are preferred. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Sphere Map Distortion. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Sphere-map texels represent differently sized regions of the environment / ■ Distortion is especially problematic in the outer region of the map / ■ Hardware performs linear texture filtering, not spherical interpolation / ■ For modern real-time graphics, this is one reason cube maps are preferred. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide 'Demo - Environment Map Distortion' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: Stage Debug Distortion / object Sphere / environmentContent Debug / mapType Spherical map / mappingType Reflection. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Demo - Environment Map Distortion. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: Stage Debug Distortion / object Sphere / environmentContent Debug / mapType Spherical map / mappingType Reflection. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Demo - Environment Map Distortion'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Sphere Map Interpolation' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Sphere maps represent non-linear images / ■ Two sphere map texels should be interpolated along an arc / • Graphics hardware does not support spherical interpolation / • Interpolation in the inner area is little distorted / • Interpolation in the outer area is highly distorted. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                                             |
| Technical commentary        | <p>This slide is about Sphere Map Interpolation. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Sphere maps represent non-linear images / ■ Two sphere map texels should be interpolated along an arc / • Graphics hardware does not support spherical interpolation / • Interpolation in the inner area is little distorted / • Interpolation in the outer area is highly distorted. The slide groups them because one object or quantity is processed into another result used later in rendering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | <p>Even a sparse slide usually names a relation you must be able to explain in words.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you turn 'Sphere Map Interpolation' into a causal sentence instead of repeating the slide title?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 97                     | Sphere Map Coordinates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | <p>The slide 'Sphere Map Coordinates' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Sphere map texture coordinates are calculated in camera coordinates / (0, 0, 0) / • Camera in origin / V -z +x +y / • View direction along the -axis ( axis to the right, axis up). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Technical commentary | This slide is about Sphere Map Coordinates. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Sphere map texture coordinates are calculated in camera coordinates / (0, 0, 0) / • Camera in origin / V -z +x +y / • View direction along the -axis ( axis to the right, axis up). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you state the coordinate space before and after 'Sphere Map Coordinates'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Page 98                     | Cube Environment Mapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Source cue                  | ■ Cube maps are represented by 6 square textures forming the sides of a cube / ■ The cube is centered around the shading point or camera / ■ Each face stores the environment as seen through one side of the cube / ■ A 3D direction vector is used to select the face and lookup position                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Cube Environment Mapping' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: ■ Cube maps are represented by 6 square textures forming the sides of a cube / ■ The cube is centered around the shading point or camera / ■ Each face stores the environment as seen through one side of the cube / ■ A 3D direction vector is used to select the face and lookup position. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Cube Environment Mapping. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: ■ Cube maps are represented by 6 square textures forming the sides of a cube / ■ The cube is centered around the shading point or camera / ■ Each face stores the environment as seen through one side of the cube / ■ A 3D direction vector is used to select the face and lookup position. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Cube Mapping Example 1/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Cube Mapping Example 1/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you turn 'Cube Mapping Example 1/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Cube Mapping Distortion' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Cube maps still distort the environment / ■ The distortion is distributed more uniformly than in sphere maps / ■ There are no pole singularities / ■ The main artifacts occur at cube-face boundaries. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |
| Technical commentary        | <p>This slide is about Cube Mapping Distortion. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Cube maps still distort the environment / ■ The distortion is distributed more uniformly than in sphere maps / ■ There are no pole singularities / ■ The main artifacts occur at cube-face boundaries. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Cube Mapping Distortion'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Page 102                    | Cube Map Texture Coordinates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Cube Map Texture Coordinates' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: <math>R = (R_x, R_y, R_z)</math> / ■ The reflection vector <math>x, y, z</math> is used as a 3D lookup direction / ■ The cube-map face is selected by the major axis of / • largest absolute component determines the face / ■ The remaining two components determine the 2D coordinates on that face. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Cube Map Texture Coordinates. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: <math>R = (R_x, R_y, R_z)</math> / ■ The reflection vector <math>x, y, z</math> is used as a 3D lookup direction / ■ The cube-map face is selected by the major axis of / • largest absolute component determines the face / ■ The remaining two components determine the 2D coordinates on that face. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | <p>Can you state the coordinate space before and after 'Cube Map Texture Coordinates'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Environment Mapping in OpenGL' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ In modern OpenGL, reflections are usually stored in a cube map / • six square images form the faces of a virtual cube / • reflection vector is used as a 3D texture coordinate / ■ Typical use cases / • reflective objects. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Environment Mapping in OpenGL. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ In modern OpenGL, reflections are usually stored in a cube map / • six square images form the faces of a virtual cube / • reflection vector is used as a 3D texture coordinate / ■ Typical use cases / • reflective objects. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Cube Map Texture Object' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Cube maps are OpenGL texture objects with target <code>GL_TEXTURE_CUBE_MAP</code> / ■ Each face is addressed by a separate cube-map face target / ■ Use immutable storage for fixed size, format, and mipmap count / 1 <code>GLuint envMap</code>; / 2 <code>glCreateTextures(GL_TEXTURE_CUBE_MAP, 1, &amp;envMap)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Cube Map Texture Object. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Cube maps are OpenGL texture objects with target <code>GL_TEXTURE_CUBE_MAP</code> / ■ Each face is addressed by a separate cube-map face target / ■ Use immutable storage for fixed size, format, and mipmap count / 1 <code>GLuint envMap</code>; / 2 <code>glCreateTextures(GL_TEXTURE_CUBE_MAP, 1, &amp;envMap)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Cube Map Texture Object'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Page 105                    | Sampling Direction                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | <p>The slide 'Sampling Direction' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: ■ A cube map is sampled with a 3D direction vector / ■ The largest absolute component of the direction selects the cube face / ■ The remaining two components determine the 2D position on that face / ■ For reflection mapping, use the reflected view vector / 1 vec3 V = normalize(cameraPosition - worldPosition). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Sampling Direction. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: ■ A cube map is sampled with a 3D direction vector / ■ The largest absolute component of the direction selects the cube face / ■ The remaining two components determine the 2D position on that face / ■ For reflection mapping, use the reflected view vector / 1 vec3 V = normalize(cameraPosition - worldPosition). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Environment Mapping in GLSL 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Use samplerCube instead of sampler2D / ■ Store positions and normals in world space / ■ Keep the cube map fixed in world space / • otherwise the reflection appears glued to the camera / 1 // Fragment shader. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Environment Mapping in GLSL 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Use samplerCube instead of sampler2D / ■ Store positions and normals in world space / ■ Keep the cube map fixed in world space / • otherwise the reflection appears glued to the camera / 1 // Fragment shader. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Environment Mapping in GLSL 1/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Environment Mapping in GLSL 2/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: 1 void main() / 2 { / 3 vec3 V = normalize(cameraPosition - vWorldPosition); / 4 vec3 N = normalize(vWorldNormal); / 5 vec3 R = reflect(-V, N). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Environment Mapping in GLSL 2/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: 1 void main() / 2 { / 3 vec3 V = normalize(cameraPosition - vWorldPosition); / 4 vec3 N = normalize(vWorldNormal); / 5 vec3 R = reflect(-V, N). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you explain how 'Environment Mapping in GLSL 2/2' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Practical Cube-Map Issues' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: <ul style="list-style-type: none"> <li>■ Cube-map reflections are an approximation</li> <li>• environment is assumed to be far away</li> <li>• object does not reflect itself</li> <li>• other moving objects are usually missing</li> <li>■ Important implementation details.</li> </ul> Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Technical commentary | This slide is about Practical Cube-Map Issues. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Cube-map reflections are an approximation / • environment is assumed to be far away / • object does not reflect itself / • other moving objects are usually missing / ■ Important implementation details. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. |
| Why it matters       | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide '1 glEnable(GL_TEXTURE_CUBE_MAP_SEAMLESS);' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: 3 glTextureParameteri(envMap, / Glass Utah teapot rendering; image: Ronak19, CC / BY-SA 4.0. / Extrahierte Tabellen: / [Tabelle 1]. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about 1 glEnable(GL_TEXTURE_CUBE_MAP_SEAMLESS);. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: 3 glTextureParameteri(envMap, / Glass Utah teapot rendering; image: Ronak19, CC / BY-SA 4.0. / Extrahierte Tabellen: / [Tabelle 1]. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in '1 glEnable(GL_TEXTURE_CUBE_MAP_SEAMLESS);'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Page 110                    | Cube Mapping Pros and Cons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | ■ Advantages / • direct hardware support / • limited distortion / • no pole singularities / • natural representation for directional data                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Cube Mapping Pros and Cons' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Advantages / • direct hardware support / • limited distortion / • no pole singularities / • natural representation for directional data. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Cube Mapping Pros and Cons. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Advantages / • direct hardware support / • limited distortion / • no pole singularities / • natural representation for directional data. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you turn 'Cube Mapping Pros and Cons' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Page 111                    | Spherical Environment Mapping Assumptions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | ■ Environment assumed far from object to be textured / ■ Self-reflection not taken into account / • Object to be textured assumed a convex shape(even if it is not geometrically convex) / ■ No other moving objects in the environment / • Interreflection is not taken into account                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Spherical Environment Mapping Assumptions' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Environment assumed far from object to be textured / ■ Self-reflection not taken into account / • Object to be textured assumed a convex shape(even if it is not geometrically convex) / ■ No other moving objects in the environment / • Interreflection is not taken into account. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary | This slide is about Spherical Environment Mapping Assumptions. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Environment assumed far from object to be textured / ■ Self-reflection not taken into account / • Object to be textured assumed a convex shape(even if it is not geometrically convex) / ■ No other moving objects in the environment / • Interreflection is not taken into account. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. |
| Why it matters       | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself       | Can you identify the sampled data, coordinate, and filtering/state issue in 'Spherical Environment Mapping Assumptions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Spherical Environment Mapping Conclusions' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Advantages / • Contains panoramic image of an environment in a single texture / • Filtering and LoD formation takes place within a single texture / ■ Disadvantages / • Singularity along the outer disc border. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Spherical Environment Mapping Conclusions. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Advantages / • Contains panoramic image of an environment in a single texture / • Filtering and LoD formation takes place within a single texture / ■ Disadvantages / • Singularity along the outer disc border. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Spherical Environment Mapping Conclusions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Source cue                  | Texturing volumetric data, solid materials, and participating media                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide '9.7 3D Textures and Volume Rendering' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Texturing volumetric data, solid materials, and participating media. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.                                                                                                                                            |
| Technical commentary        | This slide is about 9.7 3D Textures and Volume Rendering. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Texturing volumetric data, solid materials, and participating media. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide '3D Texturing: Relevant Topics' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ Data model / • Regular voxel grids, channels, formats, memory footprint / ■ Mapping model / (s, t, r) / • Texture coordinates and object-to-texture transformations. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Technical commentary | This slide is about 3D Texturing: Relevant Topics. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ Data model / • Regular voxel grids, channels, formats, memory footprint / ■ Mapping model / (s, t, r) / • Texture coordinates and object-to-texture transformations. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself       | Can you state the coordinate space before and after '3D Texturing: Relevant Topics'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide '3D Texture as a Voxel Grid' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ A 3D texture stores samples on a regular three-dimensional grid / ■ A sample is often called a voxel / ■ Each voxel can store scalar, vector, or multi-channel data / • Density, temperature, material ID / • Color and opacity. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about 3D Texture as a Voxel Grid. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ A 3D texture stores samples on a regular three-dimensional grid / ■ A sample is often called a voxel / ■ Each voxel can store scalar, vector, or multi-channel data / • Density, temperature, material ID / • Color and opacity. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to '3D Texture as a Voxel Grid'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 116                    | Object Space to Texture Space                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Object Space to Texture Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ 3D texture coordinates are usually derived from object-space position / ■ For a volume-aligned bounding box / <math>p - p / \text{object min} / (s, t, r) =</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Object Space to Texture Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ 3D texture coordinates are usually derived from object-space position / ■ For a volume-aligned bounding box / <math>p - p / \text{object min} / (s, t, r) =</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide '3D Texture Access' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: ■ For each fragment, texture coordinates are interpolated / ■ A 3D lookup fetches the neighboring voxel values / ■ Linear filtering in 3D performs trilinear interpolation. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about 3D Texture Access. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: ■ For each fragment, texture coordinates are interpolated / ■ A 3D lookup fetches the neighboring voxel values / ■ Linear filtering in 3D performs trilinear interpolation. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Trilinear Interpolation' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Trilinear interpolation is linear interpolation along three axes / ■ It blends the eight voxel values surrounding the lookup position / ■ Conceptually / • interpolate along / • interpolate the results along. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Technical commentary        | This slide is about Trilinear Interpolation. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Trilinear interpolation is linear interpolation along three axes / ■ It blends the eight voxel values surrounding the lookup position / ■ Conceptually / • interpolate along / • interpolate the results along. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you turn 'Trilinear Interpolation' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide ' $f = (1 - \alpha) \cdot f + \alpha \cdot f$ ' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: 00 000 100 / $f = (1 - \alpha) \cdot f + \alpha \cdot f$ / 01 001 101 / $f = (1 - \alpha) \cdot f + \alpha \cdot f$ / 10 010 110. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about $f = (1 - \alpha) \cdot f + \alpha \cdot f$ . The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: 00 000 100 / $f = (1 - \alpha) \cdot f + \alpha \cdot f$ / 01 001 101 / $f = (1 - \alpha) \cdot f + \alpha \cdot f$ / 10 010 110. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                             |

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | <p>The slide '3D Texture Memory Footprint' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: ■ Memory grows cubically with resolution / <math>\text{memory} = w \cdot h \cdot d \cdot \text{bytes per voxel}</math> / Resolution R8 R16F RGBA8 RGBA16F / 1 B/voxel 2 B/voxel 4 B/voxel 8 B/voxel / 2 MiB 4 MiB 8 MiB 16 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations.</p> |
| Technical commentary        | <p>This slide is about 3D Texture Memory Footprint. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: ■ Memory grows cubically with resolution / <math>\text{memory} = w \cdot h \cdot d \cdot \text{bytes per voxel}</math> / Resolution R8 R16F RGBA8 RGBA16F / 1 B/voxel 2 B/voxel 4 B/voxel 8 B/voxel / 2 MiB 4 MiB 8 MiB 16 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you compute or explain the pixel count, color depth, or memory relation in '3D Texture Memory Footprint'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | <p>The slide '3D Mipmaps and Filtering' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ 3D textures can use mipmaps analogously to 2D textures / ■ Each mip level halves width, height, and depth / <math>k + 1</math> k / ■ Level contains one eighth of the voxels of level / ■ Useful for. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Technical commentary | This slide is about 3D Mipmaps and Filtering. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ 3D textures can use mipmaps analogously to 2D textures / ■ Each mip level halves width, height, and depth / $k + 1$ / ■ Level contains one eighth of the voxels of level / ■ Useful for. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself       | Can you decide whether '3D Mipmaps and Filtering' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Solid Texturing' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ 3D textures can define material throughout the interior of an object / ■ Surface fragments sample the material at their 3D position / ■ This avoids seams caused by 2D UV unwrapping / ■ Useful for materials with volumetric structure / • wood grain. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Solid Texturing. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ 3D textures can define material throughout the interior of an object / ■ Surface fragments sample the material at their 3D position / ■ This avoids seams caused by 2D UV unwrapping / ■ Useful for materials with volumetric structure / • wood grain. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Solid Texturing'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Volumetric Data as Texture Data' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Volume data is often represented as a scalar field / <math>\rho = f(x, y, z)</math> / ■ Examples / • CT or MRI intensity / • smoke density. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations.</p> |
| Technical commentary        | <p>This slide is about Volumetric Data as Texture Data. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Volume data is often represented as a scalar field / <math>\rho = f(x, y, z)</math> / ■ Examples / • CT or MRI intensity / • smoke density. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | <p>Texture sampling is a major source of visual detail and a common source of artifacts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | <p>Can you identify the sampled data, coordinate, and filtering/state issue in 'Volumetric Data as Texture Data'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide 'Transfer Functions' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ A transfer function maps data values to optical properties / <math>T(\rho) = (c, \alpha)</math> / ■ Color emphasizes material classes or value ranges / ■ Opacity controls which structures become visible / ■ Common choices. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

| Technical commentary | This slide is about Transfer Functions. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ A transfer function maps data values to optical properties / $T(\rho) = (c, \alpha)$ / ■ Color emphasizes material classes or value ranges / ■ Opacity controls which structures become visible / ■ Common choices. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Transfer Functions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Volume Rendering with 3D Textures' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ 3D grid data is stored in a 3D texture / ■ Slice-based volume rendering draws proxy geometry through the volume / ■ Slices are usually orthogonal to the view direction / ■ Each slice samples the 3D texture and applies the transfer function / ■ Slices are blended back to front or front to back. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Volume Rendering with 3D Textures. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ 3D grid data is stored in a 3D texture / ■ Slice-based volume rendering draws proxy geometry through the volume / ■ Slices are usually orthogonal to the view direction / ■ Each slice samples the 3D texture and applies the transfer function / ■ Slices are blended back to front or front to back. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | <p>The slide 'Front-to-Back Alpha Compositing' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Volume rendering approximates absorption and emission along a ray / <math>c \alpha</math> / ■ For a sample with color <math>i</math> and opacity <math>i</math> / <math>C = C + (1 - \alpha) \cdot \alpha \cdot c</math> / out in in <math>i</math>. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about Front-to-Back Alpha Compositing. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Volume rendering approximates absorption and emission along a ray / <math>c \alpha</math> / ■ For a sample with color <math>i</math> and opacity <math>i</math> / <math>C = C + (1 - \alpha) \cdot \alpha \cdot c</math> / out in in <math>i</math>. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you decide whether 'Front-to-Back Alpha Compositing' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Ray Marching Volume Rendering' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Instead of drawing slices, cast one ray per fragment through the volume / ■ Repeatedly sample the 3D texture along the ray / ■ Apply the transfer function at every sample / ■ Composite samples until the ray exits the volume or becomes opaque / 1 for (float t = tEntry; t &lt; tExit; t += stepSize) {. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about Ray Marching Volume Rendering. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Instead of drawing slices, cast one ray per fragment through the volume / ■ Repeatedly sample the 3D texture along the ray / ■ Apply the transfer function at every sample / ■ Composite samples until the ray exits the volume or becomes opaque / 1 for (float t = tEntry; t &lt; tExit; t += stepSize) {. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | <p>Visibility decides which generated candidates are actually seen from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Gradients and Volume Lighting' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Gradients estimate local orientation in the scalar field / ■ Central differences approximate the gradient / <math>\rho(x + \Delta, y, z) - \rho(x - \Delta, y, z)</math> / ■ ■ / <math>\nabla \rho \approx</math> ■ <math>\rho(x, y + \Delta, z) - \rho(x, y - \Delta, z)</math> ■. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Gradients and Volume Lighting. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Gradients estimate local orientation in the scalar field / ■ Central differences approximate the gradient / $\rho(x + \Delta, y, z) - \rho(x - \Delta, y, z)$ / ■ ■ / $\nabla \rho \approx$ ■ $\rho(x, y + \Delta, z) - \rho(x, y - \Delta, z)$ ■. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Gradients and Volume Lighting'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Page 129                    | Quality and Performance Trade-Offs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Source cue                  | ■ Step size / • smaller steps improve quality but increase cost / • larger steps are faster but can miss thin structures / ■ Opacity correction / • keeps appearance stable when step size changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Professor-style explanation | The slide 'Quality and Performance Trade-Offs' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: ■ Step size / • smaller steps improve quality but increase cost / • larger steps are faster but can miss thin structures / ■ Opacity correction / • keeps appearance stable when step size changes. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Quality and Performance Trade-Offs. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: ■ Step size / • smaller steps improve quality but increase cost / • larger steps are faster but can miss thin structures / ■ Opacity correction / • keeps appearance stable when step size changes. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Quality and Performance Trade-Offs' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|            |                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | <p>The slide '3D Texturing Takeaways' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ 3D textures generalize 2D texture lookup from surfaces to volumes / ■ They are useful for solid materials, volumetric effects, and sampled scientific data / ■ Trilinear interpolation provides smooth access to voxel grids / ■ Volume rendering turns sampled data into color and opacity along viewing rays / ■ Transfer functions and compositing determine what becomes visible. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about 3D Texturing Takeaways. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ 3D textures generalize 2D texture lookup from surfaces to volumes / ■ They are useful for solid materials, volumetric effects, and sampled scientific data / ■ Trilinear interpolation provides smooth access to voxel grids / ■ Volume rendering turns sampled data into color and opacity along viewing rays / ■ Transfer functions and compositing determine what becomes visible. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | <p>Visibility decides which generated candidates are actually seen from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide '■ Textures are sampled GPU data sources used by shaders' collects the source material behind the chapter. References are not rendering objects themselves, but they identify the books, papers, or external resources from which the lecture's terminology and algorithms are drawn. The listed sources support the chapter content: • Color, opacity, normals, roughness, height, masks, and volume density / ■ Texture coordinates define where texture data is sampled / (s, t, r) / • UV mapping, texture transformations, and 3D coordinates / ■ Texture formats, channel semantics, and color space determine correct interpretation. They point to the books, papers, or resources behind the definitions and algorithms used in the lecture. In practical terms, a reference slide marks the boundary of the chapter and tells us where the formal definitions, derivations, or extended examples can be found if a topic needs more depth than the lecture slides provide. |
| Technical commentary        | This slide is about ■ Textures are sampled GPU data sources used by shaders. The slide lists source material or chapter references that support the technical content and give names for further reading. The listed sources support the chapter content: • Color, opacity, normals, roughness, height, masks, and volume density / ■ Texture coordinates define where texture data is sampled / (s, t, r) / • UV mapping, texture transformations, and 3D coordinates / ■ Texture formats, channel semantics, and color space determine correct interpretation. They point to the books, papers, or resources behind the definitions and algorithms used in the lecture.                                                                                                                                                                                                                                                                                                                      |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you identify which source or topic '■ Textures are sampled GPU data sources used by shaders' points to for deeper study?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                  |
| Technical commentary        | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Edition), AK / ■ Others                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide '■ Text Books' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: • J. Foley, A. van Dam, S. Fine"Computer Graphics: Principles and Practice (3About Edition)", / Addison-Wesley 2013. / • T. Akenine-Möller, E. Haines: Real-Time Rendering, Addison-Wesley. / • P. Shirley, M. AshikhminS. Marschner: Fundamentals of Computer Graphics (3rd ed. Edition), AK / ■ Others. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about ■ Text Books. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: • J. Foley, A. van Dam, S. Fine"Computer Graphics: Principles and Practice (3About Edition)", / Addison-Wesley 2013. / • T. Akenine-Möller, E. Haines: Real-Time Rendering, Addison-Wesley. / • P. Shirley, M. AshikhminS. Marschner: Fundamentals of Computer Graphics (3rd ed. Edition), AK / ■ Others. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn '■ Text Books' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## 09.1 Texture Objects, Texels, Formats, and Color Space

Source location: Section 9.1

### Commentary

A texture object stores sampled data on the GPU. A texel is one stored texture sample. The texture format decides what channels and numeric representation the samples use. Color space matters because color values may be stored nonlinearly, especially for sRGB images.

The key shift is to stop thinking of texture as only a picture. Textures can store color, normals, depth, lookup data, environment information, or volume data. The shader decides how the sampled values are interpreted.

### Mental model

A texture is a GPU-accessible sampled data field.

## Check yourself

Why can the same texture mechanism store both color maps and normal maps?

## 09.2 Texture Coordinates, UV Mapping, and Wrapping

Source location: Section 9.2

### Commentary

Texture coordinates map surface points to locations in texture space. UV coordinates are usually interpolated across primitives during rasterization and then used by the fragment shader to sample a texture.

Wrapping rules decide what happens outside the normal coordinate range. Repeat, clamp, mirrored repeat, and border behavior are not visual afterthoughts; they define the sampling function outside the base domain.

### Mental model

UVs are the address system that lets a fragment look up texture data.

## Check yourself

What artifact might appear if a wrapping mode is wrong at the edge of a surface?

## 09.3 Sampling, Filtering, Mipmaps, and Anisotropy

Source location: Section 9.3

### Commentary

Sampling turns continuous texture coordinates into values from discrete texels. Nearest filtering selects a nearby texel and can look blocky. Linear filtering blends nearby texels and looks smoother. Minification is harder because many texels may map to one pixel.

Mipmaps store prefiltered lower-resolution versions of a texture. They reduce aliasing and shimmer when textures are seen at small scale. Anisotropic filtering improves quality when a texture is viewed at a steep angle where footprint shape is elongated.

### Mental model

Filtering reconstructs values; mipmaps choose an appropriate scale before reconstruction.

## Check yourself

Why does a distant checkerboard shimmer without mipmapping?

## 09.4 Modern OpenGL Texture Pipeline

Source location: Section 9.4

### Commentary

In modern OpenGL, textures are represented by texture objects, bound to texture units, connected to sampler uniforms, and accessed in shaders. The shader does not sample a filename; it samples a bound texture

through a sampler.

Texture bugs often come from state mismatches: wrong active texture unit, wrong sampler uniform, missing mipmaps for a mipmap filter, wrong wrap mode, or wrong internal format.

## **Mental model**

OpenGL texturing is a chain: object data -> texture unit -> sampler uniform -> shader lookup.

## **Check yourself**

Why can a texture appear black when the shader code is mathematically correct?

# **09.5 Normal Mapping**

Source location: Section 9.5

## **Commentary**

Normal mapping stores normal directions in a texture so that lighting can vary at a finer scale than the geometry. The surface may have few triangles, but the shader receives detailed normals per fragment.

The hard part is coordinate space. Normal maps are often defined in tangent space, so the shader must transform or interpret them with the correct tangent, bitangent, and normal basis.

## **Mental model**

Normal mapping changes the lighting normal, not the actual mesh silhouette.

## **Check yourself**

Why does normal mapping not change the geometric outline of an object?

# **09.6 Environment Mapping and 3D Textures**

Source location: Sections 9.6-9.7

## **Commentary**

Environment mapping uses textures to represent surrounding illumination or reflections. A direction, not a surface UV alone, can be used to sample an environment map. This is a texture lookup driven by view/reflection geometry.

3D textures and volume rendering extend the same sampled-data idea into three dimensions. Instead of sampling a 2D image, the shader samples a volume. This is useful for data such as medical scans, density fields, or procedural volumetric effects.

## **Mental model**

Textures are general sampled data; the coordinate dimensionality depends on the problem.

## **Check yourself**

What coordinate type would you use to sample a 3D texture?

# **End-of-lecture summary**

If you remember only one thing from Lecture 09, remember this: This lecture treats textures as sampled data for shading, not merely images glued onto objects. It connects UV coordinates, sampling, filtering, mipmaps, OpenGL texture state, and advanced texture uses.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.

# Lecture 10 - Shadows

This lecture explains shadows as a visibility problem from the light source. A point is lit if the light can see it; it is shadowed if another object blocks that visibility.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 2                      | Shadow Perception 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | ■ Visual perception of an environment is influenced by shadows / • Object object relationships / • Object space relationships / ■ Improved depth perception is made possible by shadows / ■ Shadows provide appealing visual effects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | <p>The slide 'Shadow Perception 1/3' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Visual perception of an environment is influenced by shadows / • Object object relationships / • Object space relationships / ■ Improved depth perception is made possible by shadows / ■ Shadows provide appealing visual effects. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about Shadow Perception 1/3. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Visual perception of an environment is influenced by shadows / • Object object relationships / • Object space relationships / ■ Improved depth perception is made possible by shadows / ■ Shadows provide appealing visual effects. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | <p>Visibility decides which generated candidates are actually seen from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Page 3                      | Shadow Perception 2/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | <p>No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | <p>The slide 'Shadow Perception 2/3' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Technical commentary        | <p>This slide is about Shadow Perception 2/3. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | <p>Shadow algorithms reuse visibility ideas, but from the light's point of view.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide 'Shadow Perception 3/3' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ KerstenD. Knill, D. C., Mamassian, P. and Bülthoffl. Illusory motion from shadows, Nature, 379 (31), / 1996. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |
| Technical commentary        | This slide is about Shadow Perception 3/3. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ KerstenD. Knill, D. C., Mamassian, P. and Bülthoffl. Illusory motion from shadows, Nature, 379 (31), / 1996. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you explain what the light can or cannot see in 'Shadow Perception 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Page 5                      | Shadow Atmosphere                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide 'Shadow Atmosphere' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                                              |
| Technical commentary        | This slide is about Shadow Atmosphere. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you explain what the light can or cannot see in 'Shadow Atmosphere'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 6                      | ■ Shadows createa certain atmosphere                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | ■ The Lighthouse (2019)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide '■ Shadows createa certain atmosphere' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ The Lighthouse (2019). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.                                                    |
| Technical commentary        | This slide is about ■ Shadows createa certain atmosphere. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ The Lighthouse (2019). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to '■ Shadows createa certain atmosphere'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Page 7                      | Shadow Atmosphere                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Shadow Atmosphere' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Shadows createa certain atmosphere / ■ The Lighthouse (2019) / ■ Kill Bill: Volume 1 (2003). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Technical commentary | This slide is about Shadow Atmosphere. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Shadows create a certain atmosphere / ■ The Lighthouse (2019) / ■ Kill Bill: Volume 1 (2003). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                 |

The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: 10.1 Definitions / 10.2 Ground Plane Shadows / 10.3 Light Maps / 10.4 Shadow Volumes / 10.5 Shadow Maps. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Overview'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide '10.1 Definitions' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: About shadow-receiving and shadow-casting scene objects. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image.                                                                                                                                                                                                                           |
| Technical commentary        | This slide is about 10.1 Definitions. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: About shadow-receiving and shadow-casting scene objects. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you explain what the light can or cannot see in '10.1 Definitions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Classification of scene objects' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ Distinction between / • Shadow-casting scene objects(Occluder) / • Shadow-receiving scene objects (Receiver) / ■ Classify shadow-casting and shadow-receiving objects in a preprocess? / • Self-shadowing results from same object casting and receiving shadows. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary | This slide is about Classification of scene objects. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ Distinction between / • Shadow-casting scene objects(Occluder) / • Shadow-receiving scene objects (Receiver) / ■ Classify shadow-casting and shadow-receiving objects in a preprocess? / • Self-shadowing results from same object casting and receiving shadows. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. |
| Why it matters       | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself       | Can you explain what the light can or cannot see in 'Classification of scene objects'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Page 11                     | Umbra and Penumbra                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | ■ Point light sources / • Result in hard shadows / • High intensity contrast between shadowed and non-shadowed region / ■ Area light sources / • Result in soft shadows                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Professor-style explanation | The slide 'Umbra and Penumbra' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Point light sources / • Result in hard shadows / • High intensity contrast between shadowed and non-shadowed region / ■ Area light sources / • Result in soft shadows. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Umbra and Penumbra. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Point light sources / • Result in hard shadows / • High intensity contrast between shadowed and non-shadowed region / ■ Area light sources / • Result in soft shadows. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Umbra and Penumbra'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|            |                                                                                                                    |

| Professor-style explanation | The slide 'Hard and Soft Shadows' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Hard and Soft Shadows. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                         |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you explain what the light can or cannot see in 'Hard and Soft Shadows'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Description of Shadows' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Description of Shadows. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                         |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you explain what the light can or cannot see in 'Description of Shadows'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|            |                                                                                                                                                               |

| Professor-style explanation | <p>The slide '■ Shadows can be described differently' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Shadows can be modeled as / • Separate objects / • Surfaces not seen when looking into scene from light source / • Volumetric regions with reduced lighting. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about ■ Shadows can be described differently. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Shadows can be modeled as / • Separate objects / • Surfaces not seen when looking into scene from light source / • Volumetric regions with reduced lighting. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Observations 1/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: ■ Possible shadow generation approaches / • Shadows as surfaces: exploit hidden-surface algorithms / • Shadows as projection: create shadows from A to B by projecting A onto B from light source / ■ Static vs. dynamic scenes / • Shadows are static in scenes with static lighting and scene objects (shadow computation. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Observations 1/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: ■ Possible shadow generation approaches / • Shadows as surfaces: exploit hidden-surface algorithms / • Shadows as projection: create shadows from A to B by projecting A onto B from light source / ■ Static vs. dynamic scenes / • Shadows are static in scenes with static lighting and scene objects (shadow computation. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Observations 2/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by <math>w</math> creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: ■ Shadow shape can be obtained by projection / • Trivial for projection on flat surfaces / • Algorithmically very complex for projection in general case / ■ Shadow intensity / • Shadows attenuate the incoming light used in illumination model. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Observations 2/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: ■ Shadow shape can be obtained by projection / • Trivial for projection on flat surfaces / • Algorithmically very complex for projection in general case / ■ Shadow intensity / • Shadows attenuate the incoming light used in illumination model. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | <p>Can you explain how 'Observations 2/2' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Shadow Calculation Methods' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Ground plane shadows / • Static shadow polygons / • Dynamic shadow polygons / ■ Projected shadows / ■ Light maps. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p>                                                                                                                                                                                                                                                     |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary | This slide is about Shadow Calculation Methods. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Ground plane shadows / • Static shadow polygons / • Dynamic shadow polygons / ■ Projected shadows / ■ Light maps. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Shadow Calculation Methods'?                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide '10.2 Ground Plane Shadows' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: Static and dynamic shadow polygons. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |
| Technical commentary        | This slide is about 10.2 Ground Plane Shadows. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: Static and dynamic shadow polygons. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you explain what the light can or cannot see in '10.2 Ground Plane Shadows'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Static Shadow Polygons' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Render dark polygons to represent shadow regions / • Cast ray from light source through center of shadow-casting objects / • Position dark polygon where ray intersects shadow-receiving object / ■ Disadvantages / • Static shapes cannot represent geometry of dynamic scene objects. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about Static Shadow Polygons. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Render dark polygons to represent shadow regions / • Cast ray from light source through center of shadow-casting objects / • Position dark polygon where ray intersects shadow-receiving object / ■ Disadvantages / • Static shapes cannot represent geometry of dynamic scene objects. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | <p>Visibility decides which generated candidates are actually seen from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | <p>Can you decide whether 'Static Shadow Polygons' works per object, per image region, per ray, or per fragment?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 20                     | Render Static Shadow Polygons 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Render Static Shadow Polygons 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Depth value identical with that of shadow-receiving polygon (care must be taken wrt. z-buffer / fighting) / ■ Depth value smaller than that of shadow-receiving polygon (shadow can be too large). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Render Static Shadow Polygons 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Depth value identical with that of shadow-receiving polygon (care must be taken wrt. z-buffer / fighting) / ■ Depth value smaller than that of shadow-receiving polygon (shadow can be too large). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Render Static Shadow Polygons 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Source cue                  | ■ Disable depth test / • Cast ray to determine shadow visibility / • Show entire shadow polygon / ■ Shadow too large and possibly in wrong places / ■ Test corners for shadow visibility                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'Render Static Shadow Polygons 2/2' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Disable depth test / • Cast ray to determine shadow visibility / • Show entire shadow polygon / ■ Shadow too large and possibly in wrong places / ■ Test corners for shadow visibility. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Technical commentary | This slide is about Render Static Shadow Polygons 2/2. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Disable depth test / • Cast ray to determine shadow visibility / • Show entire shadow polygon / ■ Shadow too large and possibly in wrong places / ■ Test corners for shadow visibility. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you decide whether 'Render Static Shadow Polygons 2/2' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Static Shadow Polygons' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ Good for car racing games (static scene geometry) / ■ With fast movements and proximity of casters and receivers, wrong shadows are often not detected / as such. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |
| Technical commentary        | This slide is about Static Shadow Polygons. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ Good for car racing games (static scene geometry) / ■ With fast movements and proximity of casters and receivers, wrong shadows are often not detected / as such. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you explain what the light can or cannot see in 'Static Shadow Polygons'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|            |                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Dynamic Shadow Polygons' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ Project shadow-casting scene objects onto shadow-receiving object by modifying shape / ■ Accurate procedure for semi-transparent shadows, but only if shadows do not overlap / ■ Restrictions / • Only planar polygons on shadow-receiving scene objects possible / • No self-shadowing possible. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image.</p> |
| Technical commentary        | <p>This slide is about Dynamic Shadow Polygons. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ Project shadow-casting scene objects onto shadow-receiving object by modifying shape / ■ Accurate procedure for semi-transparent shadows, but only if shadows do not overlap / ■ Restrictions / • Only planar polygons on shadow-receiving scene objects possible / • No self-shadowing possible. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you explain what the light can or cannot see in 'Dynamic Shadow Polygons'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Shadow Projection' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: S L / ■ Shadow point (= vertex of the shadow polygon) lies on a line between light source and vertex / of shadow-casting scene object / <math>S = P - \alpha \cdot L</math> / <math>S_z = 0</math> <math>\alpha =</math>. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Shadow Projection. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: $S = P - \alpha \cdot L$ / $z = 0$ $\alpha =$ . A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. |
| Why it matters       | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                           |
| Check yourself       | Can you explain which samples/fragments are generated by 'Shadow Projection'?                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Page 25                     | Rendering Dynamic Shadow Polygons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | <ul style="list-style-type: none"> <li>Matrix transforms object into its shadow polygon</li> <li>Render scene object with shadows</li> <li>Render scene object</li> <li>Multiply current model-view -matrix with</li> <li>Render scene object in shadow color with b lending</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Rendering Dynamic Shadow Polygons' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: <ul style="list-style-type: none"> <li>Matrix transforms object into its shadow polygon</li> <li>Render scene object with shadows</li> <li>Render scene object</li> <li>Multiply current model-view -matrix with</li> <li>Render scene object in shadow color with b lending.</li> </ul> Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Rendering Dynamic Shadow Polygons. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: <ul style="list-style-type: none"> <li>Matrix transforms object into its shadow polygon</li> <li>Render scene object with shadows</li> <li>Render scene object</li> <li>Multiply current model-view -matrix with</li> <li>Render scene object in shadow color with b lending.</li> </ul> Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you state the coordinate space before and after 'Rendering Dynamic Shadow Polygons'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 26                     | 10.3 Light Maps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide '10.3 Light Maps' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: Structured lighting with textures. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.                                                                                                                                                                                                                                                                                                                                                                    |
| Technical commentary        | This slide is about 10.3 Light Maps. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: Structured lighting with textures. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to '10.3 Light Maps'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 27                     | Light Maps                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Light Maps' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: <ul style="list-style-type: none"> <li>■ Static shadows can be precomputed and stored in light maps</li> <li>■ When precomputing light maps, shadows are calculated offline(e.g. with ray tracing)</li> <li>■ Soft shadows in lightmaps</li> <li>• Interpolation of the lightmap creates soft shadow approximations</li> <li>• Light source sampling results in better results,sending multiple rays to different points of the.</li> </ul> Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Technical commentary | This slide is about Light Maps. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Static shadows can be precomputed and stored in light maps / ■ When precomputing light maps, shadows are calculated offline(e.g. with ray tracing) / ■ Soft shadows in lightmaps / • Interpolation of the lightmap creates soft shadow approximations / • Light source sampling results in better results, sending multiple rays to different points of the. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you decide whether 'Light Maps' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Page 28                     | Soft Shadows with Light Maps 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Soft Shadows with Light Maps 1/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Soft Shadows with Light Maps 1/2. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                      |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Soft Shadows with Light Maps 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|            |                                                                                                                    |

| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Soft Shadows with Light Maps 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Source cue                  | Representation of shadows by geometry enclosing them                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide '10.4 Shadow Volumes' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: Representation of shadows by geometry enclosing them. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |
| Technical commentary        | This slide is about 10.4 Shadow Volumes. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: Representation of shadows by geometry enclosing them. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you explain what the light can or cannot see in '10.4 Shadow Volumes'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Shadow Volumes' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ Shadows are considered as volume in space / ■ Originally developed by Crow in 1977 / ■ Extension by Brotman and Badler in 1984 / ■ Heidmann introduced the technology for efficient rendering of shadow volumes in 1991. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image.</p> |
| Technical commentary        | <p>This slide is about Shadow Volumes. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ Shadows are considered as volume in space / ■ Originally developed by Crow in 1977 / ■ Extension by Brotman and Badler in 1984 / ■ Heidmann introduced the technology for efficient rendering of shadow volumes in 1991. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you explain what the light can or cannot see in 'Shadow Volumes'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 32                     | Initial Considerations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Initial Considerations' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Shadow volume shape depends on shape and position of light source and shadow-caster / ■ All points inside shadow volume are shadowed / ■ Shadow volume generation / • Find silhouettes of shadow-caster regarding light source / • Extrudes silhouettes in light ray direction to create polygons. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |
| Technical commentary        | This slide is about Initial Considerations. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Shadow volume shape depends on shape and position of light source and shadow-caster / ■ All points inside shadow volume are shadowed / ■ Shadow volume generation / • Find silhouettes of shadow-caster regarding light source / • Extrudes silhouettes in light ray direction to create polygons. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you decide whether 'Initial Considerations' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Page 33                     | Shadow Volume Geometry                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Shadow Volume Geometry' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Shadow Volume Geometry. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                         |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Shadow Volume Realization' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs:</p> <ul style="list-style-type: none"> <li>■ Silhouettes edges can be found by analyzing normals</li> <li>• Silhouette edge lies between front and back face (as seen from light source)</li> <li>■ Silhouette edges are stored as vertex list containing vertices</li> <li>■ For convex shadow-casters</li> <li>L V.</li> </ul> <p>Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Shadow Volume Realization. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs:</p> <ul style="list-style-type: none"> <li>■ Silhouettes edges can be found by analyzing normals</li> <li>• Silhouette edge lies between front and back face (as seen from light source)</li> <li>■ Silhouette edges are stored as vertex list containing vertices</li> <li>■ For convex shadow-casters</li> <li>L V.</li> </ul> <p>Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Shadow Volume Realization'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'Shadow Volume Properties 1/2' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ All points inside shadow volume are shadowed / ■ Shadowing can be determined for each view ray by intersection tests / • Assumption: Camera not in shadow volume / • At each intersection with front-face shadow polygon, intersection counter cnt is incremented / • At each intersection with back-face shadow polygon, intersection counter cnt is decremented. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | <p>This slide is about Shadow Volume Properties 1/2. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ All points inside shadow volume are shadowed / ■ Shadowing can be determined for each view ray by intersection tests / • Assumption: Camera not in shadow volume / • At each intersection with front-face shadow polygon, intersection counter cnt is incremented / • At each intersection with back-face shadow polygon, intersection counter cnt is decremented. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | <p>Visibility decides which generated candidates are actually seen from the current viewpoint.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Shadow Volume Properties 2/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Technical commentary | This slide is about Shadow Volume Properties 2/2. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. |
| Why it matters       | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you explain what the light can or cannot see in 'Shadow Volume Properties 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'Stencil Shadow Volume' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■</p> <ul style="list-style-type: none"> <li>Generation of shadow volumes per frame /</li> <li>• Works well for scenes with few moving objects /</li> <li>• Expensive for complex shadow volumes /</li> <li>• Improvement by simplifying shadow-casting geometries /</li> <li>■ Four rendering passes required.</li> </ul> <p>A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image.</p> |
| Technical commentary        | <p>This slide is about Stencil Shadow Volume. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■</p> <ul style="list-style-type: none"> <li>Generation of shadow volumes per frame /</li> <li>• Works well for scenes with few moving objects /</li> <li>• Expensive for complex shadow volumes /</li> <li>• Improvement by simplifying shadow-casting geometries /</li> <li>■ Four rendering passes required.</li> </ul> <p>A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Implementation' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Determine visible scene objects / • Render scene without writing in color buffer / ■ Represent shadow volume in stencil buffer / • Initialize stencil buffer with 0 / • Render front-face shadow polygons and increment stencil buffer by 1. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Implementation. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Determine visible scene objects / • Render scene without writing in color buffer / ■ Represent shadow volume in stencil buffer / • Initialize stencil buffer with 0 / • Render front-face shadow polygons and increment stencil buffer by 1. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Implementation'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Special Case: COP in the shadows' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: ■ When COP lies in a shadow volume, the situation can be unclear / • Near - or far -plane can intersect shadow volume / ■ Possible solutions / s = 0 / • Test COP against all shadow volumes cnt. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image.</p> |

| Technical commentary | This slide is about Special Case: COP in the shadows. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: ■ When COP lies in a shadow volume, the situation can be unclear / • Near - or far -plane can intersect shadow volume / ■ Possible solutions / $s = 0$ / • Test COP against all shadow volumes cnt. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. |
| Why it matters       | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself       | Can you explain what the light can or cannot see in 'Special Case: COP in the shadows'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Shadow Volume Example' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |

| Source cue | ■ Advantages / • Shadow-casting and shadow-receiving objects can have arbitrary shapes / • Applicable for multiple light sources / • Level-of-detail adaptable through approximated geometries / • Shadow volumes for static pairs of objects and lights can be precalculated |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | <p>The slide 'Shadow Volume Conclusions' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Advantages / • Shadow-casting and shadow-receiving objects can have arbitrary shapes / • Applicable for multiple light sources / • Level-of-detail adaptable through approximated geometries / • Shadow volumes for static pairs of objects and lights can be precalculated. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Shadow Volume Conclusions. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Advantages / • Shadow-casting and shadow-receiving objects can have arbitrary shapes / • Applicable for multiple light sources / • Level-of-detail adaptable through approximated geometries / • Shadow volumes for static pairs of objects and lights can be precalculated. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | <p>Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | Depth test from the point of view of the light source                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | <p>The slide '10.5 Shadow Maps' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: Depth test from the point of view of the light source. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Technical commentary        | This slide is about 10.5 Shadow Maps. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: Depth test from the point of view of the light source. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you decide whether '10.5 Shadow Maps' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 43                     | Shadow Mapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | ■ Based on z-Buffer (contains depth relative to the light source) / ■ First used within Pixar's Renderman                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Shadow Mapping' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: ■ Based on z-Buffer (contains depth relative to the light source) / ■ First used within Pixar's Renderman. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Shadow Mapping. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: ■ Based on z-Buffer (contains depth relative to the light source) / ■ First used within Pixar's Renderman. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shadow Mapping'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Projected Shadows' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ depth texture / ■ Rendering algorithm / • Render shadow-casting objects as seen from the light source into depth texture / • Project depth texture using projective texturing when rendering shadow-receiving objects / ■ Characteristics of the process. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |
| Technical commentary        | This slide is about Projected Shadows. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ depth texture / ■ Rendering algorithm / • Render shadow-casting objects as seen from the light source into depth texture / • Project depth texture using projective texturing when rendering shadow-receiving objects / ■ Characteristics of the process. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you decide whether 'Projected Shadows' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 46                     | Depth Comparison                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Depth Comparison' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>■ For each vertex in world coordinates determine associated depth value in shadow map</li> <li>• Transform into camera's eye space</li> <li>• Use light source's 4x4 transformation matrix to transform into light's clip space</li> <li>• Compare depth value with associated depth value in shadow map.</li> </ul> <p>Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Depth Comparison. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>■ For each vertex in world coordinates determine associated depth value in shadow map</li> <li>• Transform into camera's eye space</li> <li>• Use light source's 4x4 transformation matrix to transform into light's clip space</li> <li>• Compare depth value with associated depth value in shadow map.</li> </ul> <p>Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you state the coordinate space before and after 'Depth Comparison'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Coordinate Systems' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Coordinate Systems. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                       |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you state the coordinate space before and after 'Coordinate Systems'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Pseudo Code' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: <code>// generate shadow map w.r.t light source / generateShadowMap(); // render scene from COP / for all rasterized fragments do { / Transform fragment xyz into lights coordinate system</code> . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Pseudo Code. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: <code>// generate shadow map w.r.t light source / generateShadowMap(); // render scene from COP / for all rasterized fragments do { / Transform fragment xyz into lights coordinate system</code> . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you state the coordinate space before and after 'Pseudo Code'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 49                     | Properties                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Properties' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: ■ Shadow maps are static when scene and lighting are static / ■ Shadow quality depends on shadow map resolution / ■ Shadow mapping has three main problems / • View volume problem / • Bias problem. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |
| Technical commentary        | <p>This slide is about Properties. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: ■ Shadow maps are static when scene and lighting are static / ■ Shadow quality depends on shadow map resolution / ■ Shadow mapping has three main problems / • View volume problem / • Bias problem. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Properties'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'View Volume Problem' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ When vertex lies outside light source's view volume, required depth information is missing / ■ Possible remedies / • Use cubic shadow map (similar to cubic environment map) / • Use only spotlights. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |
| Technical commentary        | This slide is about View Volume Problem. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ When vertex lies outside light source's view volume, required depth information is missing / ■ Possible remedies / • Use cubic shadow map (similar to cubic environment map) / • Use only spotlights. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you decide whether 'View Volume Problem' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Bias Problem 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Incorrect self-shadowing occurs for / all fragments with $\text{ShadowMap}(x',y') \approx z'$ / Can be corrected by / increasing depth precision of z-buffer / applying z-bias. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Bias Problem 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Incorrect self-shadowing occurs for / all fragments with $\text{ShadowMap}(x',y') \approx z'$ / Can be corrected by / increasing depth precision of z-buffer / applying z-bias. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Bias Problem 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Bias Problem 2/2' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: It is difficult to choose a good z-bias / $\text{ShadowMap}(x',y') + \text{bias}$ ? / ■ good / ■ too low / ■ too high. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |
| Technical commentary        | This slide is about Bias Problem 2/2. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: It is difficult to choose a good z-bias / $\text{ShadowMap}(x',y') + \text{bias}$ ? / ■ good / ■ too low / ■ too high. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you explain what the light can or cannot see in 'Bias Problem 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|            |                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Aliasing Problem 1/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: ■ Aliasing occurs when shadow map is undersampled(i.e., a texel in shadow map covers several / pixels) / ■ Particularly bad when camera and light source are facing each other. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Aliasing Problem 1/3. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: ■ Aliasing occurs when shadow map is undersampled(i.e., a texel in shadow map covers several / pixels) / ■ Particularly bad when camera and light source are facing each other. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | <p>Can you explain how 'Aliasing Problem 1/3' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 54                     | Aliasing Problem 2/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Aliasing Problem 2/3' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: ■ Filter (= weighted average formation over neighbors) of a depth valuedoes not make sense / ■ Percentage Closest Filtering (PCF) / • Filter results of shadow tests (weighted average of comparison results) / • Bias selection is made even more difficult / ■ Choosing the filter kernel. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |
| Technical commentary        | This slide is about Aliasing Problem 2/3. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: ■ Filter (= weighted average formation over neighbors) of a depth valuedoes not make sense / ■ Percentage Closest Filtering (PCF) / • Filter results of shadow tests (weighted average of comparison results) / • Bias selection is made even more difficult / ■ Choosing the filter kernel. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you decide whether 'Aliasing Problem 2/3' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 56                     | Aliasing Problem 3/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | ■ Averaging Filter / ■ Percentage Closest Filtering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Aliasing Problem 3/3' explains textures as sampled data fields used during shading. A texture is not only a picture; it is a structured array of texels that can store color, normals, depth, material values, environment data, or volume data. A fragment supplies texture coordinates, the texture object supplies stored samples, sampler state controls wrapping and filtering, and the shader decides what the fetched value means. The terms describe sampled data access: ■ Averaging Filter / ■ Percentage Closest Filtering. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data. The object-level relation is coordinate, texture memory, sampling rule, and shader interpretation. This relation explains why texture bugs often look visual but originate from data addressing, filtering state, mipmap completeness, or a mismatch between stored values and shader expectations. |
| Technical commentary        | This slide is about Aliasing Problem 3/3. The texturing objects on the slide define sampled data, coordinates, filtering rules, mip levels, and shader interpretation of fetched values. The terms describe sampled data access: ■ Averaging Filter / ■ Percentage Closest Filtering. Coordinates select texels, sampler state controls reconstruction, and the shader interprets the fetched value as color, normal, material, or other data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Texture sampling is a major source of visual detail and a common source of artifacts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you identify the sampled data, coordinate, and filtering/state issue in 'Aliasing Problem 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 57                     | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                                                              |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Technical commentary | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | <p>The slide '■ Shadows in Visual Perception' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test:</p> <ul style="list-style-type: none"> <li>• Enhance depth perception and object relationships /</li> <li>• Create appealing visual effects and atmosphere /</li> <li>■ Shadow Definitions and Types /</li> <li>• Shadow-casting (Occluder) vs. shadow-receiving (Receiver) objects /</li> <li>• Self-shadowing: Same object casts and receives shadow.</li> </ul> <p>Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |
| Technical commentary        | This slide is about ■ Shadows in Visual Perception. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: <ul style="list-style-type: none"> <li>• Enhance depth perception and object relationships /</li> <li>• Create appealing visual effects and atmosphere /</li> <li>■ Shadow Definitions and Types /</li> <li>• Shadow-casting (Occluder) vs. shadow-receiving (Receiver) objects /</li> <li>• Self-shadowing: Same object casts and receives shadow.</li> </ul> Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you decide whether '■ Shadows in Visual Perception' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.                                                                                                                                                                                                                                                                                                                                                                                      |
| Technical commentary        | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you identify which source or topic 'Literature and other sources used in this chapter' points to for deeper study?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide '■ Text Books' explains a shadow as a visibility relation from the light source. A surface point is lit when the light can reach it directly, and it is shadowed when another object blocks the path from the light to that point. The central objects are therefore the light, the occluder, the receiver, and some representation of light-space visibility. Depending on the method, that representation can be projected geometry, a precomputed light map, a shadow volume, or a shadow map storing depth from the light. The terms describe light-space visibility: • P. Shirley, M. AshikhminS. Marschner: Fundamentals of Computer Graphics (3rd ed. Edition), AK / ■ Research Publications / • Crow, F., Shadows Algorithms for Computers Graphics, SIGGRAPH 1977. / • Lance Williams: Casting curved shadows on curved surfaces, SIGGRAPH 1978. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. The object-level relation is light, blocker, receiver, stored visibility information, and the darkened region visible in the final camera image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Technical commentary | This slide is about ■ Text Books. The shadow objects on the slide represent visibility from the light source: occluders block light, receivers show the result, and the algorithm stores or computes that relation. The terms describe light-space visibility: • P. Shirley, M. AshikhminS. Marschner: Fundamentals of Computer Graphics (3rd ed. Edition), AK / ■ Research Publications / • Crow, F., Shadows Algorithms for Computers Graphics, SIGGRAPH 1977. / • Lance Williams: Casting curved shadows on curved surfaces, SIGGRAPH 1978. A light, an occluder, a receiver, and a stored or computed visibility representation determine where illumination is blocked. |
| Why it matters       | Shadow algorithms reuse visibility ideas, but from the light's point of view.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself       | Can you explain what the light can or cannot see in '■ Text Books'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## 10.1 Definitions

Source location: Section 10.1

### Commentary

A shadow is not simply a dark texture. It is evidence that light visibility is blocked. Important distinctions include hard versus soft shadows, umbra versus penumbra, and geometric versus precomputed approaches.

For real-time graphics, shadows are usually approximated. The approximation must answer a visibility question cheaply enough for interactive rendering.

### Mental model

Shadows are light-space visibility made visible in the camera image.

### Check yourself

Why is shadow computation related to visibility determination?

## 10.2 Ground Plane Shadows

Source location: Section 10.2

### Commentary

Ground plane shadows project an object onto a receiving plane. This is simple and can look convincing in restricted scenes, but it assumes a known planar receiver and does not handle general shadowing between arbitrary objects.

The method is useful pedagogically because it makes the geometric nature of shadows explicit: a light source, an occluder, and a receiver define where the shadow lands.

### Mental model

A planar shadow is projected geometry on a known receiver.

### Check yourself

What scene limitation makes ground plane shadows less general than shadow maps?

## 10.3 Light Maps

Source location: Section 10.3

### Commentary

Light maps store precomputed lighting or shadow information in textures. They can be efficient at runtime, but they are limited when lights, objects, or geometry move dynamically.

This is another example of a recurring graphics tradeoff: precompute for speed, but lose flexibility. Real-time rendering often mixes precomputed and dynamic techniques.

### Mental model

A light map spends storage and preprocessing to save runtime shading work.

### Check yourself

Why are light maps less suitable for fully dynamic moving lights?

## 10.4 Shadow Volumes

Source location: Section 10.4

### Commentary

Shadow volumes construct the volume of space blocked from a light by an occluder. The camera view can then determine whether visible points lie inside that volume. Stencil buffer techniques are often associated with this method.

The strength is geometric precision for hard shadows. The cost is handling silhouette edges, volume construction, and robust stencil operations. It is a good contrast to shadow maps, which are image-based from the light view.

### Mental model

A shadow volume is the 3D region where the light cannot reach.

### Check yourself

Why are silhouette edges important for constructing shadow volumes?

## 10.5 Shadow Maps

Source location: Section 10.5

### Commentary

Shadow mapping renders the scene from the light's point of view and stores depth. During the camera pass, a surface point is transformed into light space and compared against the stored depth. If it is farther than what the light saw, it is in shadow.

This method is practical and widely used, but it has artifacts. Shadow acne comes from precision/self-comparison issues. Bias can reduce acne but too much bias causes detached shadows. Resolution, filtering, and light projection strongly affect quality.

## **Mental model**

Shadow maps reuse the depth-buffer idea, but from the light's camera.

## **Check yourself**

What exactly is stored in a shadow map?

## **End-of-lecture summary**

If you remember only one thing from Lecture 10, remember this: This lecture explains shadows as a visibility problem from the light source. A point is lit if the light can see it; it is shadowed if another object blocks that visibility.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.
