

# CS8165.001 Complete Lecture Readers

Readable commentary for each lecture in the course's primary language. This document is designed to make the raw slides human-readable while keeping links back to the extracted source chunks.

## Contents

Lecture 01 - Introduction

Lecture 02 - Rendering Pipeline

Lecture 03 - Geometric Transformations

Lecture 04 - Geometric Projection

Lecture 05 - Clipping

Lecture 06 - Rasterization

Lecture 07 - Visibility Determination

Lecture 08 - Local Illumination

Lecture 09 - Texturing

Lecture 10 - Shadows

# Lecture 01 - Introduction

This lecture is the orientation layer for the whole course. It explains why interactive computer graphics is a pipeline problem: a scene must be represented, processed under time constraints, sampled into an image, and displayed fast enough for interaction.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Page 1                      | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 2                      | Course Learning Outcomes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Course Learning Outcomes' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Learn to program computer graphics applications using OpenGL / - Learn to realize efficient computer graphics applications on the GPU / - Implement your own computer graphics project / [Image Credits: Wikipedia User Mimigu] [Crassin et al., PG2011]. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Course Learning Outcomes. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Learn to program computer graphics applications using OpenGL / - Learn to realize efficient computer graphics applications on the GPU / - Implement your own computer graphics project / [Image Credits: Wikipedia User Mimigu] [Crassin et al., PG2011]. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you connect 'Course Learning Outcomes' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 3                      | Real-Time Rendering Contest Results 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | Students: Frank Richter, Manuel Herbert Güntzel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Real-Time Rendering Contest Results 1/3' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: Students: Frank Richter, Manuel Herbert Güntzel. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Real-Time Rendering Contest Results 1/3. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Students: Frank Richter, Manuel Herbert Güntzel. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the graphics capability or idea represented by 'Real-Time Rendering Contest Results 1/3' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | Students: Andreas Rottach, Matthias Englert                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'Real-Time Rendering Contest Results 2/3' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: Students: Andreas Rottach, Matthias Englert. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input.     |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Technical commentary | This slide is about Real-Time Rendering Contest Results 2/3. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Students: Andreas Rottach, Matthias Englert. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. |
| Why it matters       | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you name the graphics capability or idea represented by 'Real-Time Rendering Contest Results 2/3' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | Students: Jan Eric Haßler, Kai Viktor Freissler                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Real-Time Rendering Contest Results 3/3' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: Students: Jan Eric Haßler, Kai Viktor Freissler. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Real-Time Rendering Contest Results 3/3. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Students: Jan Eric Haßler, Kai Viktor Freissler. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the graphics capability or idea represented by 'Real-Time Rendering Contest Results 3/3' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide '1.1 Course Organization' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: Details about the lecture course. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about 1.1 Course Organization. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: Details about the lecture course. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you connect '1.1 Course Organization' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Teachers' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Lectures / timo.ropinski@uni-ulm.de / Office hours upon request / - Exercises / Poonam Aditya Sawant. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Lectures / timo.ropinski@uni-ulm.de / Office hours upon request / - Exercises / Poonam Aditya Sawant. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. |
| Why it matters       | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself       | Can you connect 'Teachers' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Course Format' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Lectures / - Tuesday (14-16) and every other Wednesdays (12-14) / - Room O28/1002 / - Specific dates/modalities in Moodle (password: ICG26SUMMER ) / - Lecture slides. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Course Format. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Lectures / - Tuesday (14-16) and every other Wednesdays (12-14) / - Room O28/1002 / - Specific dates/modalities in Moodle (password: ICG26SUMMER ) / - Lecture slides. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you connect 'Course Format' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Source cue                  | - Exercises / - Every other Wednesday (12-14) / - Room O28/1002 / - Programming in C/C++ (introduction available upon request) / - Enroll in Moodle                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Course Format' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Exercises / - Every other Wednesday (12-14) / - Room O28/1002 / - Programming in C/C++ (introduction available upon request) / - Enroll in Moodle. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Course Format. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Exercises / - Every other Wednesday (12-14) / - Room O28/1002 / - Programming in C/C++ (introduction available upon request) / - Enroll in Moodle. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you connect 'Course Format' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Page 10                     | Exercises                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Exercises' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Exercise / - Exercise 1 - Rendering Pipeline / - Exercise 2 - Primitive Types and Shaders / - Exercise 3 - Geometric Transformations / - Exercise 4 - Projection and Clipping. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Exercises. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Exercise / - Exercise 1 - Rendering Pipeline / - Exercise 2 - Primitive Types and Shaders / - Exercise 3 - Geometric Transformations / - Exercise 4 - Projection and Clipping. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you connect 'Exercises' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Successful Course Completion' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - Pass the oral/written exam / - Dates to be announced / - "Notenbonus" possible / - 50% success rate of exercise solutions for n-1 sheets / - Only running solutions are marked. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Technical commentary | This slide is about Successful Course Completion. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - Pass the oral/written exam / - Dates to be announced / - "Notenbonus" possible / - 50% success rate of exercise solutions for n-1 sheets / - Only running solutions are marked. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. |
| Why it matters       | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself       | Can you connect 'Successful Course Completion' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Source cue                  | Background / Journey along the / Rendering Pipeline / Lighting Effects / Extrahierte Tabellen:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Course Overview' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: Background / Journey along the / Rendering Pipeline / Lighting Effects / Extrahierte Tabellen. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Course Overview. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: Background / Journey along the / Rendering Pipeline / Lighting Effects / Extrahierte Tabellen. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you connect 'Course Overview' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|            |                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Literature' collects the source material behind the chapter. References are not rendering objects themselves, but they identify the books, papers, or external resources from which the lecture's terminology and algorithms are drawn. The listed sources support the chapter content: - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer Graphics / (4th Edition), AK Peters 2016. / - D. Shreiner, G. Sellers, J. Kessenich, B. Licea-Kane: OpenGL Programming / Guide: The Official Guide to Learning OpenGL / (8th Edition), Addison-Wesley 2013. They point to the books, papers, or resources behind the definitions and algorithms used in the lecture. In practical terms, a reference slide marks the boundary of the chapter and tells us where the formal definitions, derivations, or extended examples can be found if a topic needs more depth than the lecture slides provide. |
| Technical commentary        | This slide is about Literature. The slide lists source material or chapter references that support the technical content and give names for further reading. The listed sources support the chapter content: - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer Graphics / (4th Edition), AK Peters 2016. / - D. Shreiner, G. Sellers, J. Kessenich, B. Licea-Kane: OpenGL Programming / Guide: The Official Guide to Learning OpenGL / (8th Edition), Addison-Wesley 2013. They point to the books, papers, or resources behind the definitions and algorithms used in the lecture.                                                                                                                                                                                                                                                                                                                      |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you identify which source or topic 'Literature' points to for deeper study?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Relevant Chapters and Link to Lecture Course' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: - For self study. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about Relevant Chapters and Link to Lecture Course. The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: - For self study. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you connect 'Relevant Chapters and Link to Lecture Course' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 15                     | (1.1 Course Organization)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | 1.2 Computer Graphics Overview / 1.3 Pixel-based Representations / 1.4 3D Models / 1.5 Algorithmic Paradigms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide '(1.1 Course Organization)' describes the practical objects of the course: lectures, exercise sheets, programming tasks, project work, teachers, dates, tools, or submission structure. These objects are part of the learning system around the graphics content. The lecture introduces a concept, the exercise turns it into code or a calculation, and the project combines several such concepts into a working renderer. The listed course objects are connected as workflow components: 1.2 Computer Graphics Overview / 1.3 Pixel-based Representations / 1.4 3D Models / 1.5 Algorithmic Paradigms. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used. The important relation is between topic, practice format, and skill. A rendering concept that appears in an exercise is not just background vocabulary; it becomes something that can be recognized in C/C++ code, OpenGL calls, shader inputs, or debugging situations. |
| Technical commentary        | This slide is about (1.1 Course Organization). The slide connects lecture theory with exercise work, programming practice, and assessment expectations. The named dates, exercises, or course components indicate where the concept will reappear. The listed course objects are connected as workflow components: 1.2 Computer Graphics Overview / 1.3 Pixel-based Representations / 1.4 3D Models / 1.5 Algorithmic Paradigms. Lecture topics introduce concepts, exercises convert them into practice, and project or assessment elements test whether those concepts can be used.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Course logistics often reveal which topics are practiced, assessed, or expected in code.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you connect '(1.1 Course Organization)' to an exercise, project task, or exam-preparation action?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 16                     | 1.2 Computer Graphics Overview                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | Relation of the field with respect to other disciplines                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide '1.2 Computer Graphics Overview' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: Relation of the field with respect to other disciplines. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                               |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                             |

| Technical commentary | This slide is about 1.2 Computer Graphics Overview. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: Relation of the field with respect to other disciplines. The slide groups them because one object or quantity is processed into another result used later in rendering. |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                          |
| Check yourself       | Can you turn '1.2 Computer Graphics Overview' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Computer Graphics History' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: - Origins in art / - Perspective, color, etc. / - Computer graphics milestones [Reichardt, 1968] / - 1960 - "Computer Graphics", William Fetter (Boeing) / - 1962 - Spacewars, Steve Russel (MIT) Computer. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Computer Graphics History. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: - Origins in art / - Perspective, color, etc. / - Computer graphics milestones [Reichardt, 1968] / - 1960 - "Computer Graphics", William Fetter (Boeing) / - 1962 - Spacewars, Steve Russel (MIT) Computer. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you name the graphics capability or idea represented by 'Computer Graphics History' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Sutherland, Utah (1970) Wireframe. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you name the graphics capability or idea represented by 'Computer Graphics History' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Page 19                     | Computer Graphics History                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source cue                  | Sutherland, Utah (1970) Turner Whitted, Siggraph (1979)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Computer Graphics History' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: Sutherland, Utah (1970) Turner Whitted, Siggraph (1979). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Computer Graphics History. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Sutherland, Utah (1970) Turner Whitted, Siggraph (1979). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Source cue                  | The Abyss (1989) Terminator 2 (1991) Jurassic Park (1993)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Computer Graphics History' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: The Abyss (1989) Terminator 2 (1991) Jurassic Park (1993). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Computer Graphics History. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: The Abyss (1989) Terminator 2 (1991) Jurassic Park (1993). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you name the graphics capability or idea represented by 'Computer Graphics History' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 21                     | Computer Graphics History                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Computer Graphics History' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: Ikea (2014). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Computer Graphics History. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: Ikea (2014). Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you name the graphics capability or idea represented by 'Computer Graphics History' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Source cue                  | - Human-Computer Interaction / - Virtual and Augmented Reality / - Visualization / - Image Processing / - Computer Vision                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'Related Disciplines' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Human-Computer Interaction / - Virtual and Augmented Reality / - Visualization / - Image Processing / - Computer Vision. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Related Disciplines. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Human-Computer Interaction / - Virtual and Augmented Reality / - Visualization / - Image Processing / - Computer Vision. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Applications' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Computer games / - Animation movies / - Special effects in movies / - CAD/CAM [CryEngine 5.7, CryTek 2022] / - Simulation. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                              |
| Technical commentary        | This slide is about Applications. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Computer games / - Animation movies / - Special effects in movies / - CAD/CAM [CryEngine 5.7, CryTek 2022] / - Simulation. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Applications' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | What is a pixel?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Professor-style explanation | The slide '1.3 Pixel-based Representations' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: What is a pixel?. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations. |
| Technical commentary        | This slide is about 1.3 Pixel-based Representations. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: What is a pixel?. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you compute or explain the pixel count, color depth, or memory relation in '1.3 Pixel-based Representations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 25                     | Raster Images                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Source cue                  | ["Bibliothek" by press office Ulm University]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | <p>The slide 'Raster Images' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: ["Bibliothek" by press office Ulm University]. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations.</p>                                                                                                                                                                      |
| Technical commentary        | <p>This slide is about Raster Images. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: ["Bibliothek" by press office Ulm University]. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you compute or explain the pixel count, color depth, or memory relation in 'Raster Images'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 26                     | Pixel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | - Name derived from Word for Picture Element / - Pixel is a sample with associated sample values (=pixel components) / - Color / - Transparency (=alpha value) / - Depth (i.e., distance from viewer (=z value))                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | <p>The slide 'Pixel' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: - Name derived from Word for Picture Element / - Pixel is a sample with associated sample values (=pixel components) / - Color / - Transparency (=alpha value) / - Depth (i.e., distance from viewer (=z value)). Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Technical commentary | This slide is about Pixel. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: - Name derived from Word for Picture Element / - Pixel is a sample with associated sample values (=pixel components) / - Color / - Transparency (=alpha value) / - Depth (i.e., distance from viewer (=z value)). Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself       | Can you decide whether 'Pixel' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Color' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - In real world color is given / by color spectrum Day Light Light Bulb / Fluorescent Tube White LED / - In computer graphics color is represented through color models / - RGB color model (additive). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Color. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - In real world color is given / by color spectrum Day Light Light Bulb / Fluorescent Tube White LED / - In computer graphics color is represented through color models / - RGB color model (additive). Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Color'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'LCD Raster Screen' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Liquid crystal displays exist since the 90s and enable flat screens / - Liquid crystals affect the polarization of light / - Based on polarization, subpixel visibility is regulated. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about LCD Raster Screen. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Liquid crystal displays exist since the 90s and enable flat screens / - Liquid crystals affect the polarization of light / - Based on polarization, subpixel visibility is regulated. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | <p>Can you explain which samples/fragments are generated by 'LCD Raster Screen'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Raster Image Sizes' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: - Assume a raster image with 1024x768 pixels and 24-bit color depth / - How many different colors can be represented? / - <math>2^{24} = 2^8 \times 2^8 \times 2^8 = 16,777,216</math> / - How much memory does the image need? / - <math>1024 \times 768 \times 24 = 18,874,368</math> bits = 2,359,296 bytes = 2.25 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Technical commentary | This slide is about Raster Image Sizes. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: - Assume a raster image with 1024x768 pixels and 24-bit color depth / - How many different colors can be represented? / - $2^{24} = 2^8 \times 2^8 \times 2^8 = 16.777.216$ / - How much memory does the image need? / - $1024 \times 768 \times 24 = 18,874,368$ bits = 2,359,296 bytes = 2.25 MiB. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. |
| Why it matters       | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you compute or explain the pixel count, color depth, or memory relation in 'Raster Image Sizes'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | Modeling with triangles and other geometric primitives                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide '1.4 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: Modeling with triangles and other geometric primitives. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about 1.4 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: Modeling with triangles and other geometric primitives. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you name the geometric objects and attributes represented by '1.4 3D Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|            |                                                                                                                                                            |

| Professor-style explanation | The slide '3D Model Types' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Models specify the structures to be displayed / - Three commonly used model types exist / - Implicit surfaces / - Polygonal models / - Volumetric models. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about 3D Model Types. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Models specify the structures to be displayed / - Three commonly used model types exist / - Implicit surfaces / - Polygonal models / - Volumetric models. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you name the geometric objects and attributes represented by '3D Model Types' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 32                     | Implicit Surfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Source cue                  | - Set of all points that fulfill $f(x, y, z) = 0$ / - All points with $f(x, y, z) < 0$ define solid bound by $f(x, y, z) = 0$ / - Display possibilities / - Search for null points / - Approximate with polygons                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | The slide 'Implicit Surfaces' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Set of all points that fulfill $f(x, y, z) = 0$ / - All points with $f(x, y, z) < 0$ define solid bound by $f(x, y, z) = 0$ / - Display possibilities / - Search for null points / - Approximate with polygons. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                     |
| Technical commentary        | This slide is about Implicit Surfaces. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Set of all points that fulfill $f(x, y, z) = 0$ / - All points with $f(x, y, z) < 0$ define solid bound by $f(x, y, z) = 0$ / - Display possibilities / - Search for null points / - Approximate with polygons. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Implicit Surfaces' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 33                     | Quadrics                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Quadrics' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Surfaces represented by quadric equations / Ellipsoid Single Hyperboloid Double Hyperboloid / $x^2 y^2 z^2$ / $x^2 y^2 z^2 / f x, y, z = + + - 1 f x, y, z = + - - 1 f x, y, z = + - + 1 / \alpha^2 \beta^2 \gamma^2 \alpha^2 \beta^2 \gamma^2 \alpha^2 \beta^2 \gamma^2$ . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Quadrics. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Surfaces represented by quadric equations / Ellipsoid Single Hyperboloid Double Hyperboloid / $x^2 y^2 z^2$ / $x^2 y^2 z^2 / f x, y, z = + + - 1 f x, y, z = + - - 1 f x, y, z = + - + 1 / \alpha^2 \beta^2 \gamma^2 \alpha^2 \beta^2 \gamma^2 \alpha^2 \beta^2 \gamma^2$ . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Quadrics' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | Point Cloud (3D Scan) Binary Data (MRT) Signed Distance Fields (SDF) Meshes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Object Representation' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: Point Cloud (3D Scan) Binary Data (MRT) Signed Distance Fields (SDF) Meshes. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary        | This slide is about Object Representation. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: Point Cloud (3D Scan) Binary Data (MRT) Signed Distance Fields (SDF) Meshes. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Object Representation' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 35                     | Polygonal Models 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source cue                  | - Surface representation is approximated by polygons / - Polygons are made up of vertices and edges                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Polygonal Models 1/3' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Surface representation is approximated by polygons / - Polygons are made up of vertices and edges. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Polygonal Models 1/3. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Surface representation is approximated by polygons / - Polygons are made up of vertices and edges. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Polygonal Models 1/3' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 36                     | Polygonal Models 1/4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Polygonal Models 1/4' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Surface representation is approximated by polygons (mostly triangles/quads) / - Polygons are made up of vertices and edges / Valence / Degree Adjacent Edges 1-Ring Neighborhood. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.                      |
| Technical commentary        | This slide is about Polygonal Models 1/4. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Surface representation is approximated by polygons (mostly triangles/quads) / - Polygons are made up of vertices and edges / Valence / Degree Adjacent Edges 1-Ring Neighborhood. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Polygonal Models 1/4' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Source cue                  | - Surface representation are often approximated by triangular polygons / - Triangles consist of three vertices and three edges / - Display achieved through rendering by raster conversion of triangles                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Polygonal Models 2/4' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Surface representation are often approximated by triangular polygons / - Triangles consist of three vertices and three edges / - Display achieved through rendering by raster conversion of triangles. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |

| Technical commentary | This slide is about Polygonal Models 2/4. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Surface representation are often approximated by triangular polygons / - Triangles consist of three vertices and three edges / - Display achieved through rendering by raster conversion of triangles. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you name the geometric objects and attributes represented by 'Polygonal Models 2/4' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Polygonal Models 3/4' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Various attributes are associated with vertices of a polygonal model / - Colors / - Material properties / - Textures / - . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Polygonal Models 3/4. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Various attributes are associated with vertices of a polygonal model / - Colors / - Material properties / - Textures / - . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Polygonal Models 3/4' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 39                     | Polygonal Models 4/4                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Polygonal Models 4/4' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Surface normal required in many cases / - Normal is calculated through cross product: <math>\mathbf{n} = (\mathbf{b} - \mathbf{a}) \times (\mathbf{c} - \mathbf{a})</math> / - Example use cases / a b – a b / 2 3 3 2. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p> |
| Technical commentary        | <p>This slide is about Polygonal Models 4/4. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Surface normal required in many cases / - Normal is calculated through cross product: <math>\mathbf{n} = (\mathbf{b} - \mathbf{a}) \times (\mathbf{c} - \mathbf{a})</math> / - Example use cases / a b – a b / 2 3 3 2. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | <p>Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Volumetric Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Space filling object representation through voxels (volume elements) / - Display possibilities / - Rendering of extracted surfaces / - Direct rendering through specialized algorithms. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p>                                    |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Technical commentary | This slide is about Volumetric Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Space filling object representation through voxels (volume elements) / - Display possibilities / - Rendering of extracted surfaces / - Direct rendering through specialized algorithms. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you name the geometric objects and attributes represented by 'Volumetric Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Page 41                     | Model Generation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source cue                  | - Polygonal models are generated through 3D scanning or 3D modeling / (e.g., LIDAR, Blender, Cinema 4D, Maya) / - Volumetric models are generated through imaging or simulation / (e.g., CT, MRI, PET, CFD, seismic surveys)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'Model Generation' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Polygonal models are generated through 3D scanning or 3D modeling / (e.g., LIDAR, Blender, Cinema 4D, Maya) / - Volumetric models are generated through imaging or simulation / (e.g., CT, MRI, PET, CFD, seismic surveys). The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Model Generation. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Polygonal models are generated through 3D scanning or 3D modeling / (e.g., LIDAR, Blender, Cinema 4D, Maya) / - Volumetric models are generated through imaging or simulation / (e.g., CT, MRI, PET, CFD, seismic surveys). The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Model Generation' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|            |                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'Coordinate Systems' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>- Three main coordinate system exist</li> <li>- Model coordinate system - model specified in own coordinate system</li> <li>- World coordinate system - models arranged in common coordinate system</li> <li>- Eye/camera coordinate system - model in relation to camera</li> </ul> <p>To transfer between coordinate systems,. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Coordinate Systems. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion:</p> <ul style="list-style-type: none"> <li>- Three main coordinate system exist</li> <li>- Model coordinate system - model specified in own coordinate system</li> <li>- World coordinate system - models arranged in common coordinate system</li> <li>- Eye/camera coordinate system - model in relation to camera</li> </ul> <p>To transfer between coordinate systems,. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you state the coordinate space before and after 'Coordinate Systems'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 43                     | Rendering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide 'Rendering' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Rendering is the process to generate raster images from 3D models / - During rendering several steps are necessary / - Coordinate system transformation / - Visibility determination / - Illumination. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Rendering. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Rendering is the process to generate raster images from 3D models / - During rendering several steps are necessary / - Coordinate system transformation / - Visibility determination / - Illumination. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you state the coordinate space before and after 'Rendering'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | Frequently found algorithm strategies                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide '1.5 Algorithmic Paradigms' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: Frequently found algorithm strategies. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Technical commentary        | This slide is about 1.5 Algorithmic Paradigms. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: Frequently found algorithm strategies. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Photorealistic Rendering' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: - Goal: simulate reality / [Embree Ray Tracing Website - <a href="http://embree.github.io/">http://embree.github.io/</a> ] [Maisch & Ropinski, Eurographics 2017] [Hendrik vann Jenssen]. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |
| Technical commentary        | This slide is about Photorealistic Rendering. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: - Goal: simulate reality / [Embree Ray Tracing Website - <a href="http://embree.github.io/">http://embree.github.io/</a> ] [Maisch & Ropinski, Eurographics 2017] [Hendrik vann Jenssen]. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you decide whether 'Photorealistic Rendering' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Non-Photorealistic Rendering (NPR)' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Goal: abstract reality / [Suggestive contour line drawings, DeCarlo 2003]. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Non-Photorealistic Rendering (NPR). The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Goal: abstract reality / [Suggestive contour line drawings, DeCarlo 2003]. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you explain which samples/fragments are generated by 'Non-Photorealistic Rendering (NPR)'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Source cue                  | - Number of computations direct proportional to number of pixels / for all Pixels do { / for all SceneObjects do { / ... / - Benefits                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | The slide 'Image-Based Algorithms' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Number of computations direct proportional to number of pixels / for all Pixels do { / for all SceneObjects do { / ... / - Benefits. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Image-Based Algorithms. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Number of computations direct proportional to number of pixels / for all Pixels do { / for all SceneObjects do { / ... / - Benefits. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you turn 'Image-Based Algorithms' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Object-Based Algorithms' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Number of computations direct proportional to number of 3D models / for all SceneObjects do { / for all Pixels do { / ... / - Benefits. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Object-Based Algorithms. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Number of computations direct proportional to number of 3D models / for all SceneObjects do { / for all Pixels do { / ... / - Benefits. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide 'are assigned' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Raster images are formed of pixels to which colors, transparencies and depth / are assigned / polygonal models / - Most frequent building blocks of polygonal models are triangles, / which are formed of vertices and edges. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about are assigned. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Raster images are formed of pixels to which colors, transparencies and depth / are assigned / polygonal models / - Most frequent building blocks of polygonal models are triangles, / which are formed of vertices and edges. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you explain which samples/fragments are generated by 'are assigned'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Peters 2016. (Chapters 1, 3 & 21)' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Text Books / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer Graphics (4th Edition), AK / Peters 2016. (Chapters 1, 3 & 21) / - Crassin, Cyril, Fabrice Neyret, Miguel Sainz, Simon Green, and Elmar Eisemann. "Interactive / indirect illumination using voxel cone tracing." In Computer Graphics Forum, vol. 30, no. 7, pp. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type. |
| Technical commentary        | This slide is about Peters 2016. (Chapters 1, 3 & 21). The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Text Books / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer Graphics (4th Edition), AK / Peters 2016. (Chapters 1, 3 & 21) / - Crassin, Cyril, Fabrice Neyret, Miguel Sainz, Simon Green, and Elmar Eisemann. "Interactive / indirect illumination using voxel cone tracing." In Computer Graphics Forum, vol. 30, no. 7, pp. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Why it matters              | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you identify the normal, light vector, view vector, and material term relevant to 'Peters 2016. (Chapters 1, 3 & 21)'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## 01.1 Course Organization

Source location: Slides around 6-15

### Commentary

The organizational slides matter because they explain how the theory and programming parts fit together. The exercises are not separate from the lecture; they are the practical version of the same pipeline ideas. When the course says that slides are generally not self-explanatory, that is a warning: the bullet points are anchors, not a textbook.

Treat every exercise sheet as an applied checkpoint. Rendering pipeline, primitive types, shaders, transformations, projection, clipping, and rasterization are introduced in the lectures and then turned into OpenGL tasks. If a topic appears both in a lecture and an exercise, it is more likely to be exam relevant.

## **Mental model**

Lecture slides give the vocabulary; exercises force you to connect that vocabulary to code and visible output.

## **Check yourself**

Can you list the five exercise themes and connect each one to a later lecture chapter?

# **01.2 Computer Graphics Overview**

Source location: Section 1.2

## **Commentary**

Computer graphics is about generating images from descriptions. The description can be pixel-based, object-based, physically motivated, artistic, or algorithmic. The common thread is that the computer must decide what color belongs at image samples.

Interactive graphics adds a time constraint. The image is not computed once and admired; it must respond to camera motion, user input, animation, and changing state. That is why real-time rendering often uses approximations and specialized GPU stages.

## **Mental model**

Graphics is controlled image generation. Interactive graphics is controlled image generation under a strict time budget.

## **Check yourself**

What changes when a renderer must be interactive rather than offline?

# **01.3 Pixel-Based Representations**

Source location: Section 1.3

## **Commentary**

A pixel-based representation stores an image directly as samples on a grid. It is easy to display and edit locally, but it does not know the underlying 3D scene. If you zoom into a raster image, you reveal the sampling grid, not more geometry.

This is the first place where sampling becomes important. Resolution, color depth, aliasing, and frame time are not cosmetic details. They decide what information can be represented and how much data must be processed per second.

## **Mental model**

A raster image is already the answer. It contains color samples, not the geometric reasons behind them.

## Check yourself

Why can a pixel image be easy to display but hard to reinterpret as a 3D scene?

## 01.4 3D Models

Source location: Section 1.4

### Commentary

A 3D model is a structured description of objects before they become pixels. It may contain vertices, primitives, topology, normals, materials, textures, and transformations. Unlike a pixel image, it can be viewed from different camera positions.

The course mostly follows object-based rendering: start from model data, transform it, project it, rasterize it, shade it, test visibility, and finally update pixels. Later chapters explain these steps one by one.

### Mental model

A model is not an image. It is a cause from which many possible images can be generated.

## Check yourself

Which model attributes can influence final color besides vertex positions?

## 01.5 Algorithmic Paradigms

Source location: Section 1.5

### Commentary

The lecture contrasts ways to generate images. Rasterization works from objects toward pixels and is the dominant real-time pipeline. Ray-based methods work from image samples into the scene and are powerful for visibility and lighting but can be more expensive.

Do not memorize these paradigms as names only. Ask what direction information flows. Does the algorithm start from geometry and find covered pixels, or from pixels/rays and find visible geometry? That direction explains the strengths and weaknesses.

### Mental model

Rasterization asks, 'Which samples does this primitive cover?' Ray casting asks, 'What does this sample see?'

## Check yourself

Which paradigm fits OpenGL's standard real-time pipeline most directly?

## End-of-lecture summary

If you remember only one thing from Lecture 01, remember this: This lecture is the orientation layer for the whole course. It explains why interactive computer graphics is a pipeline problem: a scene must be represented, processed under time constraints, sampled into an image, and displayed fast enough for interaction.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.

# Lecture 02 - Rendering Pipeline

This lecture turns the vague idea of rendering into a concrete sequence. It is the most important debugging map in the course: if an image is wrong, the pipeline tells you where the error could have entered.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Page 1                      | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'Object-based Rendering' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - Image generation done through rasterization / - Scene objects formed by 3D models (primitives) / are transformed through successive coordinate systems / - Primitives are rasterized into fragments, which are pixel predecessors / - A subset of the fragments becomes pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter.</p> |
| Technical commentary        | <p>This slide is about Object-based Rendering. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - Image generation done through rasterization / - Scene objects formed by 3D models (primitives) / are transformed through successive coordinate systems / - Primitives are rasterized into fragments, which are pixel predecessors / - A subset of the fragments becomes pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | <p>Pipeline understanding lets you localize rendering errors instead of guessing randomly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | <p>Can you name the input and output representation for 'Object-based Rendering' in the rendering pipeline?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide '2.1 Rendering Process' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: 2.2 OpenGL Overview / 2.3 OpenGL Rendering / 2.4 OpenGL Rendering Pipeline / 2.5 Fragment Tests and Operations / 2.6 Framebuffer. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |
| Technical commentary        | This slide is about 2.1 Rendering Process. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: 2.2 OpenGL Overview / 2.3 OpenGL Rendering / 2.4 OpenGL Rendering Pipeline / 2.5 Fragment Tests and Operations / 2.6 Framebuffer. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide '2.1 Rendering Process' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: From 3D models over fragments to pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |

| Technical commentary | This slide is about 2.1 Rendering Process. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: From 3D models over fragments to pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. |
| Why it matters       | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you name the input and output representation for '2.1 Rendering Process' in the rendering pipeline?                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Geometry-based Rendering 1/2' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: CPU Application GPU Rendering Display Hardware / Rendering / 3D Model Framebuffer / Process / Video. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |
| Technical commentary        | This slide is about Geometry-based Rendering 1/2. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: CPU Application GPU Rendering Display Hardware / Rendering / 3D Model Framebuffer / Process / Video. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Geometry-based Rendering 2/2' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - The rendering process is realized through the rendering pipeline / - Renders 3D models to 2D images / - Conceptually, the rendering pipeline consists of two GPU stages / - Geometry stage - processes geometric primitives / - Rasterization stage - processes fragments and pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter.</p> |
| Technical commentary        | <p>This slide is about Geometry-based Rendering 2/2. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - The rendering process is realized through the rendering pipeline / - Renders 3D models to 2D images / - Conceptually, the rendering pipeline consists of two GPU stages / - Geometry stage - processes geometric primitives / - Rasterization stage - processes fragments and pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | <p>Pipeline understanding lets you localize rendering errors instead of guessing randomly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Application Stage' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Specification of the model elements and the scene / as well as interaction capabilities / - Scene modeling: arrangement and attribution of the scene objects / - Calculation of animation paths / - Collision detection. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                                   |
| Technical commentary        | This slide is about Application Stage. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Specification of the model elements and the scene / as well as interaction capabilities / - Scene modeling: arrangement and attribution of the scene objects / - Calculation of animation paths / - Collision detection. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Application Stage' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 8                      | Geometry Stage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Geometry Stage' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: x x / - Geometric 3D transformation / Model Coordinate System World Coordinate System / - Alignment of individual scene objects in the overall scene / - Basic transformations: translation, scaling, rotation. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

| Technical commentary | This slide is about Geometry Stage. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $x \times$ / - Geometric 3D transformation / Model Coordinate System World Coordinate System / - Alignment of individual scene objects in the overall scene / - Basic transformations: translation, scaling, rotation. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you state the coordinate space before and after 'Geometry Stage'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Rasterization Stage' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Conversion of primitives into fragments (rasterization) / - Discretization takes place in relation to a target grid / - Rasterization algorithms optimized for certain primitives / (e.g., lines, triangles) / - After rasterization per-fragment tests are performed. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about Rasterization Stage. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Conversion of primitives into fragments (rasterization) / - Discretization takes place in relation to a target grid / - Rasterization algorithms optimized for certain primitives / (e.g., lines, triangles) / - After rasterization per-fragment tests are performed. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you explain which samples/fragments are generated by 'Rasterization Stage'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide '2.2 OpenGL Overview' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Library for real-time computer graphics. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about 2.2 OpenGL Overview. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Library for real-time computer graphics. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in '2.2 OpenGL Overview'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Page 11                     | OpenGL History                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Source cue                  | - Unified graphics software interface was missing / as knowledge channeled into proprietary software packages / - HP's starbase / - SGI's Graphics Library (GL) / - Some standardization efforts existed                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'OpenGL History' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: - Unified graphics software interface was missing / as knowledge channeled into proprietary software packages / - HP's starbase / - SGI's Graphics Library (GL) / - Some standardization efforts existed. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Technical commentary | This slide is about OpenGL History. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: - Unified graphics software interface was missing / as knowledge channeled into proprietary software packages / - HP's starbase / - SGI's Graphics Library (GL) / - Some standardization efforts existed. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. |
| Why it matters       | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself       | Can you name the graphics capability or idea represented by 'OpenGL History' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'OpenGL' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - OpenGL (Open Graphics Library) / - Platform independent 2D and 3D graphics API / - API specification is provided by the Khronos Group / - Technical implementation / - Rendering pipeline consisting of static and programmable pipeline stages. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |
| Technical commentary        | This slide is about OpenGL. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - OpenGL (Open Graphics Library) / - Platform independent 2D and 3D graphics API / - API specification is provided by the Khronos Group / - Technical implementation / - Rendering pipeline consisting of static and programmable pipeline stages. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'OpenGL vs. Vulkan' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - How about Vulkan? / - More modern than OpenGL / - Designed for high performance and low-level GPU control / - Better suited for complex, large-scale rendering engines / - Vulkan also harder to learn and requires more setup/code. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL vs. Vulkan. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - How about Vulkan? / - More modern than OpenGL / - Designed for high performance and low-level GPU control / - Better suited for complex, large-scale rendering engines / - Vulkan also harder to learn and requires more setup/code. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL vs. Vulkan'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | <p>The slide 'OpenGL Libraries' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Different tastes of OpenGL / - OpenGL / - OpenGL ES - limited version for embedded systems / - WebGL - Javascript connection for Web Development / (functionality similar to OpenGL ES). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about OpenGL Libraries. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Different tastes of OpenGL / - OpenGL / - OpenGL ES - limited version for embedded systems / - WebGL - Javascript connection for Web Development / (functionality similar to OpenGL ES). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Libraries'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'OpenGL Functionality' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Functional API / - Objects, scenes and images are described by a sequence of commands / (functional approach, low-level) / - Contrast: scene or object description (declarative approach, high-level) / - OpenGL context. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Functionality. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Functional API / - Objects, scenes and images are described by a sequence of commands / (functional approach, low-level) / - Contrast: scene or object description (declarative approach, high-level) / - OpenGL context. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Functionality'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 16                     | OpenGL Context                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Source cue                  | - Context is created and modified by the application, / and contains all the state variables of the OpenGL engine / - Any number of contexts per application possible, / but at most one active context per application / - Context is generally tied to an output window                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide 'OpenGL Context' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution:</p> <ul style="list-style-type: none"> <li>- Context is created and modified by the application, / and contains all the state variables of the OpenGL engine</li> <li>- Any number of contexts per application possible, / but at most one active context per application</li> <li>- Context is generally tied to an output window. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</li> </ul> |
| Technical commentary        | <p>This slide is about OpenGL Context. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution:</p> <ul style="list-style-type: none"> <li>- Context is created and modified by the application, / and contains all the state variables of the OpenGL engine</li> <li>- Any number of contexts per application possible, / but at most one active context per application</li> <li>- Context is generally tied to an output window. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Context'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'OpenGL Rendering Process' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - Initiation from the developer's perspective / - Creation of the output window / - Creation of the context / - Specification of the scene geometry / - Uploading of the scene geometry to the GPU. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |
| Technical commentary        | This slide is about OpenGL Rendering Process. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - Initiation from the developer's perspective / - Creation of the output window / - Creation of the context / - Specification of the scene geometry / - Uploading of the scene geometry to the GPU. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you name the input and output representation for 'OpenGL Rendering Process' in the rendering pipeline?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Page 18                     | Window Creation with GLFW 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | <pre>#include &lt;GLFW/glfw3.h&gt; / #include &lt;stdlib.h&gt; / #include &lt;stdio.h&gt; / static void error_callback(int error, const char* description) { / fputs(description, stderr);</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | The slide 'Window Creation with GLFW 1/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: <pre>#include &lt;GLFW/glfw3.h&gt; / #include &lt;stdlib.h&gt; / #include &lt;stdio.h&gt; / static void error_callback(int error, const char* description) { / fputs(description, stderr).</pre> The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                                                                                                                          |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Window Creation with GLFW 1/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: <code>#include &lt;GLFW/glfw3.h&gt; / #include &lt;stdlib.h&gt; / #include &lt;stdio.h&gt; / static void error_callback(int error, const char* description) { / fputs(description, stderr). The slide groups them because one object or quantity is processed into another result used later in rendering.</code> |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you turn 'Window Creation with GLFW 1/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Page 19                     | Window Creation with GLFW 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | <code>int main(void){ / GLFWwindow* window; / glfwSetErrorCallback(error_callback); / if (!glfwInit()) exit(EXIT_FAILURE); / window = glfwCreateWindow(640, 480, "Simple example", NULL, NULL);</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Window Creation with GLFW 2/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: <code>int main(void){ / GLFWwindow* window; / glfwSetErrorCallback(error_callback); / if (!glfwInit()) exit(EXIT_FAILURE); / window = glfwCreateWindow(640, 480, "Simple example", NULL, NULL).</code> The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Window Creation with GLFW 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: <code>int main(void){ / GLFWwindow* window; / glfwSetErrorCallback(error_callback); / if (!glfwInit()) exit(EXIT_FAILURE); / window = glfwCreateWindow(640, 480, "Simple example", NULL, NULL).</code> The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you turn 'Window Creation with GLFW 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'OpenGL Naming Conventions' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Function-Prefix "gl" / - glClear, ... / - Constant-Prefix "GL" / - GL_POLYGON, GL_LINES, ... / - Parameter types are explicitly encoded in function names. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Naming Conventions. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Function-Prefix "gl" / - glClear, ... / - Constant-Prefix "GL" / - GL_POLYGON, GL_LINES, ... / - Parameter types are explicitly encoded in function names. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Naming Conventions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide '2.3 OpenGL Rendering' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Transfer of 3D models to the GPU. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about 2.3 OpenGL Rendering. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Transfer of 3D models to the GPU. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in '2.3 OpenGL Rendering'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 22                     | OpenGL Rendering (until V2.1)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Source cue                  | - Rendering is done through Immediate Mode / void renderScene() { / glColor3f(0.0f, 1.0f, 0.0f); // drawing color becomes green / glBegin(GL_POLYGON); // begin primitive / glVertex2f(-0.5f,-0.5f); // 1. vertex                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Professor-style explanation | The slide 'OpenGL Rendering (until V2.1)' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Rendering is done through Immediate Mode / void renderScene() { / glColor3f(0.0f, 1.0f, 0.0f); // drawing color becomes green / glBegin(GL_POLYGON); // begin primitive / glVertex2f(-0.5f,-0.5f); // 1. vertex. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Rendering (until V2.1). The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Rendering is done through Immediate Mode / void renderScene() { / glColor3f(0.0f, 1.0f, 0.0f); // drawing color becomes green / glBegin(GL_POLYGON); // begin primitive / glVertex2f(-0.5f,-0.5f); // 1. vertex. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Rendering (until V2.1)'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'OpenGL Rendering (since V3.0)' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Using Vertex Array Objects (VAOs) / - Vertex specification in CPU memory / - Vertex data transfer from CPU to GPU / - Memory layout description of the vertex data / - Number of vertices, number of components (x, y, z, ...). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about OpenGL Rendering (since V3.0). The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Using Vertex Array Objects (VAOs) / - Vertex specification in CPU memory / - Vertex data transfer from CPU to GPU / - Memory layout description of the vertex data / - Number of vertices, number of components (x, y, z, ...). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Rendering (since V3.0)'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide '1. Vertex Specification' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Vertex data is specified as a C array / // vertices of two triangles / GLfloat vertices[6][2] = { // 6 vertices with two components each (x,y) / {0.0, 1.0}, {1.0, 1.0}, {1.0, 0.0}, // 1. triangle / {0.5, 0.5}, {1.0, 0.3}, {0.7, 1.0} // 2. triangle. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about 1. Vertex Specification. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Vertex data is specified as a C array / // vertices of two triangles / GLfloat vertices[6][2] = { // 6 vertices with two components each (x,y) / {0.0, 1.0}, {1.0, 1.0}, {1.0, 0.0}, // 1. triangle / {0.5, 0.5}, {1.0, 0.3}, {0.7, 1.0} // 2. triangle. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | <p>The slide '2. Vertex Data Transfer' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - VBO allocation and data transfer via / - <code>glBufferData(GL_ARRAY_BUFFER, size, data, GL_STATIC_DRAW)</code>; / - data - address in main memory (i.e., vertices or <code>&amp;vertices[0]</code>) / - size - size of data in number of bytes / (i.e. <code>sizeof(vertices)</code> or <code>numVertices*sizeof(GLfloat)*2</code>). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about 2. Vertex Data Transfer. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - VBO allocation and data transfer via / - <code>glBufferData(GL_ARRAY_BUFFER, size, data, GL_STATIC_DRAW)</code>; / - data - address in main memory (i.e., vertices or <code>&amp;vertices[0]</code>) / - size - size of data in number of bytes / (i.e. <code>sizeof(vertices)</code> or <code>numVertices*sizeof(GLfloat)*2</code>). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in '2. Vertex Data Transfer'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide '3. Memory Layout Description' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: - Memory layout is described by the following function / - glVertexAttribPointer(attribIndex, size, type, normalized, stride, offset); / - attribIndex - attribute number (0 for position, later more ...) / - size - number of components per vertex (2 for xy, 3 for xyz) / - type - base type (typically GL_FLOAT or GL_DOUBLE). Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations.</p> |
| Technical commentary        | <p>This slide is about 3. Memory Layout Description. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: - Memory layout is described by the following function / - glVertexAttribPointer(attribIndex, size, type, normalized, stride, offset); / - attribIndex - attribute number (0 for position, later more ...) / - size - number of components per vertex (2 for xy, 3 for xyz) / - type - base type (typically GL_FLOAT or GL_DOUBLE). Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | <p>The slide '4. VAO Drawing 1/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Drawing is done with the command / - <code>glDrawArrays(mode, first, count);</code> / - mode - specifies the primitive type (e.g., <code>GL_TRIANGLES</code> or <code>GL_LINES</code>) / - From all vertices, the next count vertices are drawn from index first / - Actual vertex data no longer needs to be specified. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about 4. VAO Drawing 1/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Drawing is done with the command / - <code>glDrawArrays(mode, first, count);</code> / - mode - specifies the primitive type (e.g., <code>GL_TRIANGLES</code> or <code>GL_LINES</code>) / - From all vertices, the next count vertices are drawn from index first / - Actual vertex data no longer needs to be specified. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide '4. VAO Drawing 2/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - There is a small number of primitive types / - Points / - Lines, Line Strips, Line Loops / - Triangles, Triangle Strips, Triangle Fans, Patches / v2 v2 v2. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p>                                                                                                                                                              |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Technical commentary | This slide is about 4. VAO Drawing 2/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - There is a small number of primitive types / - Points / - Lines, Line Strips, Line Loops / - Triangles, Triangle Strips, Triangle Fans, Patches / v2 v2 v2. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. |
| Why it matters       | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself       | Can you explain which samples/fragments are generated by '4. VAO Drawing 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide '5. GPU Memory Release' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: - After usage VAO and VBO should be deleted from GPU memory / - glDeleteBuffers(...); / - glDeleteVertexArrays(...). Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations. |
| Technical commentary        | This slide is about 5. GPU Memory Release. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: - After usage VAO and VBO should be deleted from GPU memory / - glDeleteBuffers(...); / - glDeleteVertexArrays(...). Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you compute or explain the pixel count, color depth, or memory relation in '5. GPU Memory Release'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|            |                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Rendering Initialization 1/2' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation:</p> <pre>static void init_render_scene(void) { / static const GLfloat vertices[6][2] = { / {0.0f, 1.0f}, {1.0f, 1.0f}, {1.0f, 0.0f}, /* 1st triangle */ / {0.5f, 0.5f}, {1.0f, 0.3f}, {0.7f, 1.0f} /* 2nd triangle */ / static const char* vs_src = .</pre> <p>A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about Rendering Initialization 1/2. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation:</p> <pre>static void init_render_scene(void) { / static const GLfloat vertices[6][2] = { / {0.0f, 1.0f}, {1.0f, 1.0f}, {1.0f, 0.0f}, /* 1st triangle */ / {0.5f, 0.5f}, {1.0f, 0.3f}, {0.7f, 1.0f} /* 2nd triangle */ / static const char* vs_src = .</pre> <p>A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you explain which samples/fragments are generated by 'Rendering Initialization 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 31                     | Rendering Initialization 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | <pre>program = create_program(vs_src, fs_src); / glGenVertexArrays(1, &amp;vao); / glGenBuffers(1, &amp;vbo); / glBindVertexArray(vao); / glBindBuffer(GL_ARRAY_BUFFER, vbo);</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Rendering Initialization 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: <code>program = create_program(vs_src, fs_src); / glGenVertexArrays(1, &amp;vao); / glGenBuffers(1, &amp;vbo); / glBindVertexArray(vao); / glBindBuffer(GL_ARRAY_BUFFER, vbo)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Rendering Initialization 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: <code>program = create_program(vs_src, fs_src); / glGenVertexArrays(1, &amp;vao); / glGenBuffers(1, &amp;vbo); / glBindVertexArray(vao); / glBindBuffer(GL_ARRAY_BUFFER, vbo)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Rendering Initialization 2/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Page 32                     | Rendering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | <pre>static void render_scene(void) { / glClear(GL_COLOR_BUFFER_BIT); / glUseProgram(program); / glBindVertexArray(vao); / glDrawArrays(GL_TRIANGLES, 0, 6);</pre>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | <p>The slide 'Rendering' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: <code>static void render_scene(void) { / glClear(GL_COLOR_BUFFER_BIT); / glUseProgram(program); / glBindVertexArray(vao); / glDrawArrays(GL_TRIANGLES, 0, 6)</code>. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Technical commentary | This slide is about Rendering. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: <code>static void render_scene(void) { /<br/>glClear(GL_COLOR_BUFFER_BIT); / glUseProgram(program); /<br/>glBindVertexArray(vao); / glDrawArrays(GL_TRIANGLES, 0, 6)</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Rendering'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | The slide 'Additional Attributes' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Additional attributes are necessary for drawing / - Color, normals, texture coordinates, ... / - There are two ways to assign these attributes to the vertex data / - Attributes are bound to the same VAO in separate VBO / - Attributes are stored interleaved with vertex data,. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Additional Attributes. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Additional attributes are necessary for drawing / - Color, normals, texture coordinates, ... / - There are two ways to assign these attributes to the vertex data / - Attributes are bound to the same VAO in separate VBO / - Attributes are stored interleaved with vertex data,. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you state the coordinate space before and after 'Additional Attributes'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Source cue                  | Programmable and static stages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | <p>The slide '2.4 OpenGL Rendering Pipeline' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: Programmable and static stages. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter.</p>                                                                                                 |
| Technical commentary        | <p>This slide is about 2.4 OpenGL Rendering Pipeline. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: Programmable and static stages. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | <p>The slide 'The Rendering Pipeline 1/2' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: Scene Description Raster Image / Geometry Fragment / Rasterization / Processing Processing / Vertices Primitives Fragments Pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter.</p> |

| Technical commentary | This slide is about The Rendering Pipeline 1/2. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: Scene Description Raster Image / Geometry Fragment / Rasterization / Processing Processing / Vertices Primitives Fragments Pixels. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. |
| Why it matters       | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself       | Can you name the input and output representation for 'The Rendering Pipeline 1/2' in the rendering pipeline?                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'The Rendering Pipeline 2/2' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - Sequence of fixed and programmable stages Programmable / Vertex Processing / - Process is influenced by context and scene objects / Context Fixed Function / - Programmable levels are programmed. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter. |
| Technical commentary        | This slide is about The Rendering Pipeline 2/2. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - Sequence of fixed and programmable stages Programmable / Vertex Processing / - Process is influenced by context and scene objects / Context Fixed Function / - Programmable levels are programmed. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | Pipeline understanding lets you localize rendering errors instead of guessing randomly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you name the input and output representation for 'The Rendering Pipeline 2/2' in the rendering pipeline?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 37                     | Shader Programming - History 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Shader Programming - History 1/2' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: - There is special graphics hardware (dedicated) / and general graphics hardware (general purpose) / - Special graphics hardware / - Volume Rendering: VolumePro / - Game consoles: Custom NVIDIA chips in Xbox. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input. |
| Technical commentary        | This slide is about Shader Programming - History 1/2. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: - There is special graphics hardware (dedicated) / and general graphics hardware (general purpose) / - Special graphics hardware / - Volume Rendering: VolumePro / - Game consoles: Custom NVIDIA chips in Xbox. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you name the graphics capability or idea represented by 'Shader Programming - History 1/2' and why it mattered historically?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 38                     | Shader Programming - History 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Source cue                  | - Various vendor-dependent extensions are introduced / to provide extensibility for general graphics hardware / - Texture shaders and register combiners allowed modification / through the application of textures / - Applicability is very limited by the possibilities of graphics hardware                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Shader Programming - History 2/2' explains the historical background behind the graphics concept. Computer graphics did not appear as one finished pipeline; it developed from older ideas such as artistic perspective, color representation, display hardware, interactive systems, and increasingly programmable rendering algorithms. The historical objects on the slide are people, systems, dates, or milestones, and each milestone marks a capability that later became normal in graphics software. The names, dates, and examples form a timeline: - Various vendor-dependent extensions are introduced / to provide extensibility for general graphics hardware / - Texture shaders and register combiners allowed modification / through the application of textures / - Applicability is very limited by the possibilities of graphics hardware. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering. This history matters because it shows why the course combines mathematics, image representation, hardware acceleration, and interaction. Modern real-time rendering is the result of these threads converging into a pipeline that can generate images fast enough for user input.</p> |
| Technical commentary        | <p>This slide is about Shader Programming - History 2/2. The slide places the technical topic into the historical development of computer graphics, showing how artistic perspective, display technology, interaction, and rendering algorithms evolved together. The names, dates, and examples form a timeline: - Various vendor-dependent extensions are introduced / to provide extensibility for general graphics hardware / - Texture shaders and register combiners allowed modification / through the application of textures / - Applicability is very limited by the possibilities of graphics hardware. Each item marks a capability or use case that pushed graphics from static image construction toward interactive, programmable rendering.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Why it matters              | <p>Historical slides explain why the current pipeline exists and which older problems led to modern graphics concepts.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | <p>The slide 'Assembler Shader' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - First OpenGL extensions support shader programming in assembler code / !! ARBvp1.0 / ATTRIB iPos = vertex.position ; / ATTRIB iNormal = vertex.normal ; / . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Assembler Shader. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - First OpenGL extensions support shader programming in assembler code / !! ARBvp1.0 / ATTRIB iPos = vertex.position ; / ATTRIB iNormal = vertex.normal ; / . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Assembler Shader'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 40                     | High-Level Shading Languages 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'High-Level Shading Languages 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Assembler code is hard to read and hard to maintain / - High-level languages for shading are specified in C-like syntax / - Source code is translated by the compiler into appropriate ASM statements / - Using shaders after initial binding automatically when rendering geometry / - Interface to OpenGL by passing appropriate variables or changing the OpenGL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about High-Level Shading Languages 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Assembler code is hard to read and hard to maintain / - High-level languages for shading are specified in C-like syntax / - Source code is translated by the compiler into appropriate ASM statements / - Using shaders after initial binding automatically when rendering geometry / - Interface to OpenGL by passing appropriate variables or changing the OpenGL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'High-Level Shading Languages 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Existing high level languages for shader development / - CG - C for Graphics by NVIDIA / - CG was introduced in 2003 by NVIDIA as a platform independent solution / (in practice rather semi-platform independent) / - HLSL - High Level Shading Language from Microsoft. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about High-Level Shading Languages 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Existing high level languages for shader development / - CG - C for Graphics by NVIDIA / - CG was introduced in 2003 by NVIDIA as a platform independent solution / (in practice rather semi-platform independent) / - HLSL - High Level Shading Language from Microsoft. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'High-Level Shading Languages 2/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'Shader Types' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Pipeline concept has been kept in place / and shaders are responsible for different stages / - First, geometry level programming was done by vertex shaders / - Vertex shaders allow modifiability of vertex transformations and lighting / - After that, there was an extension for image-based algorithms by fragment. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Shader Types. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Pipeline concept has been kept in place / and shaders are responsible for different stages / - First, geometry level programming was done by vertex shaders / - Vertex shaders allow modifiability of vertex transformations and lighting / - After that, there was an extension for image-based algorithms by fragment. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shader Types'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Vertex Shader Concepts' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Vertex shaders enable the programmable modification of processed geometry / - Possibilities of a vertex shader / Programmable / - Geometric transformation of vertices and normals / Vertex Processing. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Vertex Shader Concepts. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Vertex shaders enable the programmable modification of processed geometry / - Possibilities of a vertex shader / Programmable / - Geometric transformation of vertices and normals / Vertex Processing. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Vertex Shader Concepts'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Page 44                     | Vertex Shader Examples 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Professor-style explanation | The slide 'Vertex Shader Examples 1/2' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Vertex Shader Examples 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Vertex Shader Examples 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 45                     | Vertex Shader Examples 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | - Morphing / - Shadow volume calculation for shadow effects / [ID Software's Doom III]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Professor-style explanation | The slide 'Vertex Shader Examples 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Morphing / - Shadow volume calculation for shadow effects / [ID Software's Doom III]. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Vertex Shader Examples 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Morphing / - Shadow volume calculation for shadow effects / [ID Software's Doom III]. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Vertex Shader Examples 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Vertex Shader Coordinate Systems 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Vertex shaders are executed for each vertex / - Vertex shaders calculate coordinates in clipping coordinates as output / - Vertex shaders can not / - Access adjacent vertices / - Change the number of vertices (i.e., generate or discard vertices). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Vertex Shader Coordinate Systems 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Vertex shaders are executed for each vertex / - Vertex shaders calculate coordinates in clipping coordinates as output / - Vertex shaders can not / - Access adjacent vertices / - Change the number of vertices (i.e., generate or discard vertices). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Vertex Shader Coordinate Systems 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Local Space World Space View Space Clip Space Screen Space / Viewport / M M M / model view project Transform. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Vertex Shader Coordinate Systems 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Local Space World Space View Space Clip Space Screen Space / Viewport / M M M / model view project Transform. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Vertex Shader Coordinate Systems 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Local Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Coordinates of your object relative to its local origin / - 3D vertex positions. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Technical commentary        | This slide is about Local Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Coordinates of your object relative to its local origin / - 3D vertex positions. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you state the coordinate space before and after 'Local Space'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 49                     | World Space                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | - Coordinates in respect of a larger world / - Relative to some global origin of the world / - Together with many other objects                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'World Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Coordinates in respect of a larger world / - Relative to some global origin of the world / - Together with many other objects. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about World Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Coordinates in respect of a larger world / - Relative to some global origin of the world / - Together with many other objects. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you state the coordinate space before and after 'World Space'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'View Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Coordinates as seen from the camera. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                            |
| Technical commentary        | This slide is about View Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Coordinates as seen from the camera. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you state the coordinate space before and after 'View Space'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Clip Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Clip coordinates range from -1 to 1 / - Projection (Orthographic, Perspective). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Clip Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Clip coordinates range from -1 to 1 / - Projection (Orthographic, Perspective). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | - Transform to image coordinates with glViewport / - Results are sent to the rasterizer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Screen Space' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Transform to image coordinates with glViewport / - Results are sent to the rasterizer. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Screen Space. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Transform to image coordinates with glViewport / - Results are sent to the rasterizer. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Coordinate Systems' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Local Space World Space View Space Clip Space Screen Space / Viewport / M M M / model view project Transform. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                                                  |
| Technical commentary        | This slide is about Coordinate Systems. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Local Space World Space View Space Clip Space Screen Space / Viewport / M M M / model view project Transform. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you state the coordinate space before and after 'Coordinate Systems'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 54                     | Vertex Shader Variables                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | - Input types / - Uniforms: read only in VS (& FS) // Intrinsic vertex attributes / out gl_PerVertex { / - For example: light position or light color / vec4 gl_Position;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Professor-style explanation | The slide 'Vertex Shader Variables' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Input types / - Uniforms: read only in VS (& FS) // Intrinsic vertex attributes / out gl_PerVertex { / - For example: light position or light color / vec4 gl_Position. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

| Technical commentary | This slide is about Vertex Shader Variables. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Input types / - Uniforms: read only in VS (& FS) // Intrinsic vertex attributes / out gl_PerVertex { / - For example: light position or light color / vec4 gl_Position. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Vertex Shader Variables'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Fixed Function Vertex Postprocessing' explains clipping as a geometric boundary operation. A line segment, polygon, or triangle is compared with a window, plane, or volume. The part inside the valid region survives, the part outside is removed, and a primitive crossing the boundary receives newly computed intersection points. The terms describe boundary decisions: - Clipping / - Discard invisible geometries / Programmable / - Perspective Division / Vertex Processing. A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary. The objects involved are the original primitive, the clipping boundary, an inside/outside classification, intersection points, and the resulting clipped primitive. The core idea is not simply deleting geometry; clipping can reshape geometry so that the rasterizer receives only the meaningful visible portion. |
| Technical commentary        | This slide is about Fixed Function Vertex Postprocessing. The clipping objects on the slide classify geometry against boundaries and produce accepted, rejected, or newly intersected primitive pieces. The terms describe boundary decisions: - Clipping / - Discard invisible geometries / Programmable / - Perspective Division / Vertex Processing. A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Clipping decides what geometry is allowed to reach rasterization and can create new boundary vertices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you decide what is accepted, rejected, or newly intersected in 'Fixed Function Vertex Postprocessing'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Fixed Function Rasterization' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Geometry is converted to raster coordinates / Programmable / Vertex Processing / Fixed Function / Primitives Fragments Vertex Postprocessing. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Fixed Function Rasterization. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Geometry is converted to raster coordinates / Programmable / Vertex Processing / Fixed Function / Primitives Fragments Vertex Postprocessing. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you state the coordinate space before and after 'Fixed Function Rasterization'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 57                     | Fragment Shader Concept 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Fragment Shader Concept 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Fragment shaders set the color of a pixel / - Possibilities of a fragment shader / Programmable / - Glare of textures / Vertex Processing. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.     |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Technical commentary | This slide is about Fragment Shader Concept 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Fragment shaders set the color of a pixel / - Possibilities of a fragment shader / Programmable / - Glare of textures / Vertex Processing. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Fragment Shader Concept 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Page 58                     | Fragment Shader Concept 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | - Fragment shaders are executed for fragments (= pixel predecessors) / - Fragment shaders calculate the color and depth value of the current fragment / - No information about adjacent fragments available / - The number of fragments can be changed / - Fragment shaders can not generate fragments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Fragment Shader Concept 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Fragment shaders are executed for fragments (= pixel predecessors) / - Fragment shaders calculate the color and depth value of the current fragment / - No information about adjacent fragments available / - The number of fragments can be changed / - Fragment shaders can not generate fragments. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Fragment Shader Concept 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Fragment shaders are executed for fragments (= pixel predecessors) / - Fragment shaders calculate the color and depth value of the current fragment / - No information about adjacent fragments available / - The number of fragments can be changed / - Fragment shaders can not generate fragments. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Shader Example' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: layout (std140) uniform Matrices { Vertex Shader / mat4 projModelViewMatrix; / mat3 normalMatrix; /** Fragment Shader / }; * Set fragment color to red. / in vec3 position. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Shader Example. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: layout (std140) uniform Matrices { Vertex Shader / mat4 projModelViewMatrix; / mat3 normalMatrix; /** Fragment Shader / }; * Set fragment color to red. / in vec3 position. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shader Example'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'GLSL Shader Functions' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Trigonometry functions / - radians, degrees, sin, cos, tan, asin, acos, atan / - Power calculations / - pow, exp2, log2, sqrt, inversesqrt / - General. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.            |
| Technical commentary        | This slide is about GLSL Shader Functions. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Trigonometry functions / - radians, degrees, sin, cos, tan, asin, acos, atan / - Power calculations / - pow, exp2, log2, sqrt, inversesqrt / - General. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'GLSL Shader Functions'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Page 61                     | Shader Usage                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Shader Usage' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - One or multiple shaders are attached to a shader program / Vertex Shader / glCreateShader glCreateProgram / Fragment Shader / glShaderSource glAttachShader glCreateShader. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

| Technical commentary | This slide is about Shader Usage. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - One or multiple shaders are attached to a shader program / Vertex Shader / <code>glCreateShader</code> <code>glCreateProgram</code> / Fragment Shader / <code>glShaderSource</code> <code>glAttachShader</code> <code>glCreateShader</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shader Usage'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Page 62                     | Binding Shaders                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Source cue                  | <code>v = glCreateShader(GL_VERTEX_SHADER); // vertex shader / char* vs = readTextFile("vertex-shader.vert"); / const char* vv = vs; / glShaderSource(v, 1, &amp;vv, NULL); / free(vs);</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Binding Shaders' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: <code>v = glCreateShader(GL_VERTEX_SHADER); // vertex shader / char* vs = readTextFile("vertex-shader.vert"); / const char* vv = vs; / glShaderSource(v, 1, &amp;vv, NULL); / free(vs)</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Binding Shaders. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: <code>v = glCreateShader(GL_VERTEX_SHADER); // vertex shader / char* vs = readTextFile("vertex-shader.vert"); / const char* vv = vs; / glShaderSource(v, 1, &amp;vv, NULL); / free(vs)</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Binding Shaders'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 63                     | Setting Uniforms                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Source cue                  | - Uniforms are used to communicate between CPU and GPU / - Data is bound to uniform locations / - Must be updated after each linking process / <code>GLint loc0 = glGetUniformLocation(p, "isoValue_"); / glUniform1f(loc0, 0.45f);</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | The slide 'Setting Uniforms' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Uniforms are used to communicate between CPU and GPU / - Data is bound to uniform locations / - Must be updated after each linking process / <code>GLint loc0 = glGetUniformLocation(p, "isoValue_"); / glUniform1f(loc0, 0.45f)</code> . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Setting Uniforms. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Uniforms are used to communicate between CPU and GPU / - Data is bound to uniform locations / - Must be updated after each linking process / <code>GLint loc0 = glGetUniformLocation(p, "isoValue_"); / glUniform1f(loc0, 0.45f)</code> . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you turn 'Setting Uniforms' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 64                     | Shader Performance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | - Guidelines for efficient shaders / - Since fragment shaders are executed for a large number of fragments, / they should contain as few instructions as possible / - There should be as little as possible a change of the active shaders, / because they have their own state and, accordingly, the pipeline may need                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Shader Performance' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution:</p> <ul style="list-style-type: none"> <li>- Guidelines for efficient shaders</li> <li>- Since fragment shaders are executed for a large number of fragments, / they should contain as few instructions as possible /</li> <li>- There should be as little as possible a change of the active shaders, / because they have their own state and, accordingly, the pipeline may need.</li> </ul> <p>Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Shader Performance. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution:</p> <ul style="list-style-type: none"> <li>- Guidelines for efficient shaders</li> <li>- Since fragment shaders are executed for a large number of fragments, / they should contain as few instructions as possible /</li> <li>- There should be as little as possible a change of the active shaders, / because they have their own state and, accordingly, the pipeline may need.</li> </ul> <p>Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shader Performance'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Shader Development Environments 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - FX Composer, NVPerfHUD (NVIDIA) / - HLSL Shader IDE with performance analytics / <a href="http://www.developer.nvidia.com/page/tools.html">www.developer.nvidia.com/page/tools.html</a> / - RenderMonkey (ATI) / - HLSL, GLSL Shader IDE with performance analytics. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Shader Development Environments 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - FX Composer, NVPerfHUD (NVIDIA) / - HLSL Shader IDE with performance analytics / <a href="http://www.developer.nvidia.com/page/tools.html">www.developer.nvidia.com/page/tools.html</a> / - RenderMonkey (ATI) / - HLSL, GLSL Shader IDE with performance analytics. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Professor-style explanation | The slide 'Shader Development Environments 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Shdr online GLSL editor: <a href="https://shdr.bkcore.com/">https://shdr.bkcore.com/</a> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.                                                                                                                                                                           |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Technical commentary | This slide is about Shader Development Environments 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Shdr online GLSL editor: <a href="https://shdr.bkcore.com/">https://shdr.bkcore.com/</a> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Shader Development Environments 2/2'?                                                                                                                                                                                                                                                                                                                                                                                         |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Page 67                     | 2.5 Fragment Tests and Operations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Source cue                  | Towards the finishing line to the pixel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide '2.5 Fragment Tests and Operations' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: Towards the finishing line to the pixel. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations. |
| Technical commentary        | This slide is about 2.5 Fragment Tests and Operations. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: Towards the finishing line to the pixel. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you explain which samples/fragments are generated by '2.5 Fragment Tests and Operations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|            |                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Fragment Tests and Operations 1/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - After fragments have been generated, they must go through the per-fragment / tests and operations / Programmable / - Only if all these tests are successful, / Vertex Processing. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.                                                                                                                                                                                                                                        |
| Technical commentary        | This slide is about Fragment Tests and Operations 1/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - After fragments have been generated, they must go through the per-fragment / tests and operations / Programmable / - Only if all these tests are successful, / Vertex Processing. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you turn 'Fragment Tests and Operations 1/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Page 69                     | Fragment Tests and Operations 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | Fragment Pixel Ownership Scissor Alpha / Data Test Test Test / Depth Stencil / Framebuffer Dithering Blending / Test Test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Fragment Tests and Operations 2/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Fragment Pixel Ownership Scissor Alpha / Data Test Test Test / Depth Stencil / Framebuffer Dithering Blending / Test Test. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary | This slide is about Fragment Tests and Operations 2/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Fragment Pixel Ownership Scissor Alpha / Data Test Test Test / Depth Stencil / Framebuffer Dithering Blending / Test Test. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Fragment Tests and Operations 2/2'?                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Page 70                     | Alpha Test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | - If framebuffer is an RGBA buffer, the alpha test can be performed / - The test must first be activated / glEnable(GL_ALPHA_TEST); / - The comparison function indicates which fragments survive the test / glAlphaFunc(func, value);                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Alpha Test' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - If framebuffer is an RGBA buffer, the alpha test can be performed / - The test must first be activated / glEnable(GL_ALPHA_TEST); / - The comparison function indicates which fragments survive the test / glAlphaFunc(func, value). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Alpha Test. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - If framebuffer is an RGBA buffer, the alpha test can be performed / - The test must first be activated / glEnable(GL_ALPHA_TEST); / - The comparison function indicates which fragments survive the test / glAlphaFunc(func, value). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Alpha Test'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 71                     | Stencil Test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Stencil Test' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Stencil Buffer / - Is a frame buffer component / - Is (indirectly) filled by drawing operations / - No special stencil drawing operations / - Stencil operation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Stencil Test. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Stencil Buffer / - Is a frame buffer component / - Is (indirectly) filled by drawing operations / - No special stencil drawing operations / - Stencil operation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Stencil Test'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 72                     | Depth Test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Source cue                  | - If the framebuffer has a depth buffer, the depth test can be performed / - The test must first be activated / glEnable(GL_DEPTH_TEST); / - The comparison is made with the depth value already in the buffer / - The comparison function indicates which fragments survive the test                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Depth Test' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - If the framebuffer has a depth buffer, the depth test can be performed / - The test must first be activated / <code>glEnable(GL_DEPTH_TEST)</code> ; / - The comparison is made with the depth value already in the buffer / - The comparison function indicates which fragments survive the test. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Depth Test. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - If the framebuffer has a depth buffer, the depth test can be performed / - The test must first be activated / <code>glEnable(GL_DEPTH_TEST)</code> ; / - The comparison is made with the depth value already in the buffer / - The comparison function indicates which fragments survive the test. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Depth Test'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Image Composition and Mixture' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Alpha values of the pixels / - control the combination of pixel values / - are specified as color components of color pixels / - $P = [R, G, B, A]$ , with $R, G, B, A \in [0,1]$ / - Applications are manifold. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Technical commentary | This slide is about Image Composition and Mixture. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Alpha values of the pixels / - control the combination of pixel values / - are specified as color components of color pixels / - $P = [R, G, B, A]$ , with $R, G, B, A \in [0,1]$ / - Applications are manifold. The slide groups them because one object or quantity is processed into another result used later in rendering. |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you turn 'Image Composition and Mixture' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Blending Application' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Example application for transparency: drawing with semi-transparent brush. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Blending Application. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Example application for transparency: drawing with semi-transparent brush. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Blending Process 1/2' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Blending is an operation called per fragment / - Fragments are modified after rasterization, / but before writing to the framebuffer with a blending function / - Combination of a source fragment to be written with the destination pixel / in the frame buffer by using a blending function. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Blending Process 1/2. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Blending is an operation called per fragment / - Fragments are modified after rasterization, / but before writing to the framebuffer with a blending function / - Combination of a source fragment to be written with the destination pixel / in the frame buffer by using a blending function. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Blending Process 1/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 76                     | Blending Process 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | <p>- Source factor: F / - Destination factor: F / - Source fragment: [P , P , P , P ] / s,r s,g s,b s,a / - Destination pixel: [P , P , P , P ]</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Professor-style explanation | <p>The slide 'Blending Process 2/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Source factor: F / - Destination factor: F / - Source fragment: [P , P , P , P ] / s,r s,g s,b s,a / - Destination pixel: [P , P , P , P ]. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Blending Process 2/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Source factor: F / - Destination factor: F / - Source fragment: [P , P , P , P ] / s,r s,g s,b s,a / - Destination pixel: [P , P , P , P ]. The slide groups them because one object or quantity is processed into another result used later in rendering. |
| Why it matters       | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself       | Can you turn 'Blending Process 2/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Applying Blending' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Switch on (or switch off) blending / - glEnable(GL_BLEND); / - glDisable(GL_BLEND); / - Defining Blending Factors / - glBlendFunc(srcFac, destFac). The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Applying Blending. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Switch on (or switch off) blending / - glEnable(GL_BLEND); / - glDisable(GL_BLEND); / - Defining Blending Factors / - glBlendFunc(srcFac, destFac). The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |

The terms form an input-operation-output relation: - Example 1: Copy source pixels and overwrite destination pixels / - <code>glBlendFunc(GL_ONE, GL_ZERO);</code> / - $P = [P_s, P_r, P_g, P_b]$ / <code>blend s,r s,g s,b s,a</code> / - Example 2: Alpha-based mixing of source pixels and destination pixels. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you turn 'Blending Examples' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 79                     | 2.6 Framebuffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | Contains everything that is (in)visible on the screen                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide '2.6 Framebuffer' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Contains everything that is (in)visible on the screen. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about 2.6 Framebuffer. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Contains everything that is (in)visible on the screen. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in '2.6 Framebuffer'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 80                     | Viewport                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | - Rectangular area in pixel grid, set explicitly / - Rendering operations are limited to this area / - All primitives that are completely or partially outside / are clipped at the viewport area (clipping)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Professor-style explanation | The slide 'Viewport' explains clipping as a geometric boundary operation. A line segment, polygon, or triangle is compared with a window, plane, or volume. The part inside the valid region survives, the part outside is removed, and a primitive crossing the boundary receives newly computed intersection points. The terms describe boundary decisions: - Rectangular area in pixel grid, set explicitly / - Rendering operations are limited to this area / - All primitives that are completely or partially outside / are clipped at the viewport area (clipping). A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary. The objects involved are the original primitive, the clipping boundary, an inside/outside classification, intersection points, and the resulting clipped primitive. The core idea is not simply deleting geometry; clipping can reshape geometry so that the rasterizer receives only the meaningful visible portion. |
| Technical commentary        | This slide is about Viewport. The clipping objects on the slide classify geometry against boundaries and produce accepted, rejected, or newly intersected primitive pieces. The terms describe boundary decisions: - Rectangular area in pixel grid, set explicitly / - Rendering operations are limited to this area / - All primitives that are completely or partially outside / are clipped at the viewport area (clipping). A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Clipping decides what geometry is allowed to reach rasterization and can create new boundary vertices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you decide what is accepted, rejected, or newly intersected in 'Viewport'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 81                     | Framebuffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Framebuffer' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Context-bound raster with a resolution and structure / specified by the application / - Physical realization on the GPU / - Logical subdivision / - Color memory. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Framebuffer. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Context-bound raster with a resolution and structure / specified by the application / - Physical realization on the GPU / - Logical subdivision / - Color memory. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Framebuffer'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Page 82                     | OpenGL Framebuffers 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'OpenGL Framebuffers 1/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Typical OpenGL framebuffer configuration / 8bit Stencil Buffer / 32bit Depth Buffer / = 32bit Color Buffer. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.                                           |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Technical commentary | This slide is about OpenGL Framebuffers 1/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Typical OpenGL framebuffer configuration / 8bit Stencil Buffer / 32bit Depth Buffer / = 32bit Color Buffer. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Framebuffers 1/3'?                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Page 83                     | OpenGL Framebuffers 2/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | - All buffers of a frame buffer have the same grid size / - Number of bitplanes per buffer can be configured individually / - Individual buffers are directly supported by the hardware / - Buffer identifier / - GL_COLOR_BUFFER_BIT                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide 'OpenGL Framebuffers 2/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - All buffers of a frame buffer have the same grid size / - Number of bitplanes per buffer can be configured individually / - Individual buffers are directly supported by the hardware / - Buffer identifier / - GL_COLOR_BUFFER_BIT. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Framebuffers 2/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - All buffers of a frame buffer have the same grid size / - Number of bitplanes per buffer can be configured individually / - Individual buffers are directly supported by the hardware / - Buffer identifier / - GL_COLOR_BUFFER_BIT. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Framebuffers 2/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Page 84                     | OpenGL Framebuffers 3/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'OpenGL Framebuffers 3/3' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Delete a buffer / <code>glClear(GLbitfield mask);</code> / - Set the initialization color for the color buffer / <code>glClearColor(1.0,1.0,1.0,1.0);</code> / <code>glClear(GL_COLOR_BUFFER_BIT);</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about OpenGL Framebuffers 3/3. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Delete a buffer / <code>glClear(GLbitfield mask);</code> / - Set the initialization color for the color buffer / <code>glClearColor(1.0,1.0,1.0,1.0);</code> / <code>glClear(GL_COLOR_BUFFER_BIT);</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Framebuffers 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Page 85                     | Double Buffering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Source cue                  | - Use of two color buffers to avoid flicker effects / - Image buildup takes place in the background (back buffer) / - Visible image is independent of this (front buffer) / Rendering / Process                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Double Buffering' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Use of two color buffers to avoid flicker effects / - Image buildup takes place in the background (back buffer) / - Visible image is independent of this (front buffer) / Rendering / Process. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Double Buffering. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Use of two color buffers to avoid flicker effects / - Image buildup takes place in the background (back buffer) / - Visible image is independent of this (front buffer) / Rendering / Process. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Double Buffering'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Page 86                     | 2.7 Pixel-based Rendering                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Source cue                  | Direct pixel processing without involving 3D models                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide '2.7 Pixel-based Rendering' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: Direct pixel processing without involving 3D models. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations.                                                                                                                                                                                                                               |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Technical commentary | This slide is about 2.7 Pixel-based Rendering. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: Direct pixel processing without involving 3D models. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. |
| Why it matters       | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                           |
| Check yourself       | Can you compute or explain the pixel count, color depth, or memory relation in '2.7 Pixel-based Rendering'?                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Pixel-based Rendering Operations' explains raster images as concrete stored data. A raster image is a rectangular grid of pixels. Each pixel stores one or more channel values, such as red, green, blue, and sometimes alpha. Color depth tells us how many bits are available per pixel or per channel, and that immediately determines both the number of representable colors and the memory footprint of the image. The numerical values belong to one memory calculation: - Generally / - Read and write operations for various image data formats, / usually as an external library (e.g., DevIl) / - Conversions between image data types / - In OpenGL done with framebuffer objects. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost. The object relation is pixel count, bits per pixel, color range, and memory size. This is why a simple image-resolution question is also a performance question: more pixels and more bits mean more memory traffic, more storage, and more work for display or image-processing operations. |
| Technical commentary        | This slide is about Pixel-based Rendering Operations. The slide describes image data as discrete samples: pixels, color channels, bit depth, memory layout, and the amount of storage needed for a raster image. The numerical values belong to one memory calculation: - Generally / - Read and write operations for various image data formats, / usually as an external library (e.g., DevIl) / - Conversions between image data types / - In OpenGL done with framebuffer objects. Resolution gives the number of pixels, color depth gives bits per pixel, and their product gives storage and bandwidth cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Pixel-data slides connect visual output to memory size, bandwidth, precision, and image-processing cost.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you compute or explain the pixel count, color depth, or memory relation in 'Pixel-based Rendering Operations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Image Operations' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Rendering image data with OpenGL / Copy Pixel Data / Draw/Read / Pixel / Geometry. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Image Operations. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Rendering image data with OpenGL / Copy Pixel Data / Draw/Read / Pixel / Geometry. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Image Operations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | - glDrawPixels(x, y, width, height, format, type, pixels); / - Example // 64x64 array with rgb components / GLubyte img[64][64][3]; / void draw() {                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Professor-style explanation | The slide 'Write Pixels into Framebuffer' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - glDrawPixels(x, y, width, height, format, type, pixels); / - Example // 64x64 array with rgb components / GLubyte img[64][64][3]; / void draw() {. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Write Pixels into Framebuffer. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - <code>glDrawPixels(x, y, width, height, format, type, pixels);</code> / - Example <code>// 64x64 array with rgb components / GLubyte img[64][64][3]; / void draw() {</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Write Pixels into Framebuffer'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Page 90                     | Read Pixels from Framebuffer                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Source cue                  | - <code>glReadPixels(x, y, width, height, format, type, pixels);</code> / - Example <code>/ GLubyte* img = 0; / int width, height; // canvas size / void snapshot() {</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Professor-style explanation | The slide 'Read Pixels from Framebuffer' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - <code>glReadPixels(x, y, width, height, format, type, pixels);</code> / - Example <code>/ GLubyte* img = 0; / int width, height; // canvas size / void snapshot() {</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Read Pixels from Framebuffer. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - <code>glReadPixels(x, y, width, height, format, type, pixels);</code> / - Example <code>/ GLubyte* img = 0; / int width, height; // canvas size / void snapshot() {</code> . Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Read Pixels from Framebuffer'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | <p>The slide 'Formats &amp; Data Types' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Format information for pixel array operations / - GL_RGB - red-green-blue values of the frame buffer (FB) / - GL_RED - red values of the FB / - GL_ALPHA - transparency values of the FB / - GL_RGBA - red-Green-Blue-Alpha values of the FB. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about Formats &amp; Data Types. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Format information for pixel array operations / - GL_RGB - red-green-blue values of the frame buffer (FB) / - GL_RED - red values of the FB / - GL_ALPHA - transparency values of the FB / - GL_RGBA - red-Green-Blue-Alpha values of the FB. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | <p>OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | <p>Can you name the OpenGL object, state, shader stage, or buffer involved in 'Formats &amp; Data Types'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | <p>The slide 'coordinate systems in the geometry stage' explains rendering as a chain of object transformations. At the beginning there is scene information: models, vertices, primitives, attributes, camera state, and rendering state. The geometry part of the pipeline changes where the objects are and how they are represented; vertices become positioned data, vertices are assembled into primitives, and primitives are prepared for conversion to the image grid. The terms are successive representations in object-based rendering: - Rendering pipeline consist of geometry stage and rasterization stage / - Geometric primitives (mostly triangles) are transformed through different / coordinate systems in the geometry stage / - Rasterization results in fragments, which are pixel predecessors / - Fragments have to endure a sequence of tests in the rasterization stage, in. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels. The important story is that the same scene information changes form several times. A triangle is first model data, then transformed geometry, then a projected primitive, then a set of fragments, and finally only some of those fragments become pixel updates. This is why the pipeline is not just a drawing diagram; it is the explanation for where image errors can enter.</p> |
| Technical commentary        | <p>This slide is about coordinate systems in the geometry stage. Scene or model data moves through a sequence of representations: vertices, primitives, fragments, tests, and framebuffer updates. Each named object is one stage in that conversion. The terms are successive representations in object-based rendering: - Rendering pipeline consist of geometry stage and rasterization stage / - Geometric primitives (mostly triangles) are transformed through different / coordinate systems in the geometry stage / - Rasterization results in fragments, which are pixel predecessors / - Fragments have to endure a sequence of tests in the rasterization stage, in. Scene data becomes vertices, vertices become primitives, primitives become fragments, and only passing fragments update pixels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Why it matters              | <p>Pipeline understanding lets you localize rendering errors instead of guessing randomly.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | <p>Can you name the input and output representation for 'coordinate systems in the geometry stage' in the rendering pipeline?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | <p>The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p> |

| Technical commentary        | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you identify which source or topic 'Literature and other sources used in this chapter' points to for deeper study?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Professor-style explanation | The slide 'Guide: The Official Guide to Learning OpenGL' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Text Books / - D. Shreiner, G. Sellers, J. Kessenich, B. Licea-Kane: OpenGL Programming / Guide: The Official Guide to Learning OpenGL / (8th Edition), Addison-Wesley 2013. / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Guide: The Official Guide to Learning OpenGL. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. Licea-Kane: OpenGL Programming / Guide: The Official Guide to Learning OpenGL / (8th Edition), Addison-Wesley 2013. / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Guide: The Official Guide to Learning OpenGL'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## 02.1 Rendering Process

Source location: Section 2.1

### Commentary

Object-based rendering starts with scene objects represented as primitives. The pipeline transforms vertices, assembles primitives, rasterizes them into fragments, and lets only some fragments become pixels. The important detail is that the representation changes at every stage.

The application stage prepares data and state. The geometry stage handles positions and primitives. The rasterization stage creates fragments and applies fragment operations. This separation helps you explain both theory questions and black-screen OpenGL bugs.

### Mental model

Vertices become primitives, primitives become fragments, and fragments compete to become pixel updates.

### Check yourself

What is the difference between a fragment and a final pixel?

## 02.2 OpenGL Overview

Source location: Section 2.2

### Commentary

OpenGL is an API for controlling a graphics pipeline. It is not a renderer by itself in the sense of a single command that understands your scene. You create a context, provide buffers, set state, compile shaders, bind objects, and issue draw calls.

Modern OpenGL is stateful and shader-based. Many errors happen because the programmer assumes that a later call carries more information than it really does. The GPU uses the currently bound objects and current state at draw time.

### Mental model

OpenGL draw calls consume the state machine as it exists right now.

### Check yourself

Why can binding the wrong vertex array or shader program produce a valid draw call with wrong output?

## 02.3 OpenGL Rendering

Source location: Section 2.3

### Commentary

Older OpenGL exposed a fixed-function style where many transformations and lighting choices were configured through predefined calls. Modern OpenGL expects you to write shader programs and explicitly manage data flow.

This is not just historical trivia. It explains why shader code, vertex attributes, uniforms, and buffer objects are central in the exercises. If the shader expects an attribute and the vertex layout does not provide it, the

pipeline has no magic fallback.

## **Mental model**

Modern OpenGL makes the data path explicit; that gives control but also creates responsibility.

## **Check yourself**

Which data usually goes into vertex attributes, and which data usually goes into uniforms?

# **02.4 OpenGL Rendering Pipeline**

Source location: Section 2.4

## **Commentary**

The vertex shader runs per vertex and usually outputs clip-space position plus attributes for later interpolation. Primitive assembly groups vertices into points, lines, or triangles. Clipping handles geometry outside the view volume. Rasterization creates fragments.

The fragment shader computes candidate fragment output, often using interpolated attributes, uniforms, and textures. After that, tests and operations such as depth testing, stencil testing, blending, and masking decide what reaches the framebuffer.

## **Mental model**

Programmable shaders compute values; fixed pipeline stages decide coverage, interpolation, tests, and output rules.

## **Check yourself**

If your geometry appears in wireframe but colors are wrong, which stages become suspicious?

# **02.5 Fragment Tests, Framebuffer, and Pixel-Based Rendering**

Source location: Sections 2.5-2.7

## **Commentary**

Fragment tests are the gatekeepers after shading. A fragment can have a perfectly valid color and still fail because depth, stencil, scissor, masking, or blending state prevents a visible update. This is why final pixels are a subset of generated fragments.

The framebuffer stores the final render targets: color buffers, depth buffers, stencil buffers, or custom attachments. Pixel-based rendering starts from image data instead of geometric primitives, which is useful for image processing but conceptually different from the object-to-pixel pipeline.

## **Mental model**

The framebuffer is the destination; fragment operations are the rules for writing into it.

## **Check yourself**

Why can two fragments with different colors produce only one visible pixel color?

## End-of-lecture summary

If you remember only one thing from Lecture 02, remember this: This lecture turns the vague idea of rendering into a concrete sequence. It is the most important debugging map in the course: if an image is wrong, the pipeline tells you where the error could have entered.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.

# Lecture 03 - Geometric Transformations

This lecture explains how geometry moves between coordinate systems. Almost every later topic assumes that you can track where a point or vector currently lives.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

| Page 1                      | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 2                      | Transforming 3D Models                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | - 3D models need to be positioned and oriented in the virtual world / (sometimes scaling and other modifications are necessary) / - These modifications are performed by applying transformations to the / vertices describing a 3D model / - Transformations are applied through                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Transforming 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - 3D models need to be positioned and oriented in the virtual world / (sometimes scaling and other modifications are necessary) / - These modifications are performed by applying transformations to the / vertices describing a 3D model / - Transformations are applied through. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Transforming 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - 3D models need to be positioned and oriented in the virtual world / (sometimes scaling and other modifications are necessary) / - These modifications are performed by applying transformations to the / vertices describing a 3D model / - Transformations are applied through. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Transforming 3D Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide '3.1 Mathematical Foundations' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: 3.2 Affine Transformations / 3.3 Composition of Transformations / 3.4 Coordinate System Change / 3.5 Transformations in OpenGL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary | This slide is about 3.1 Mathematical Foundations. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: 3.2 Affine Transformations / 3.3 Composition of Transformations / 3.4 Coordinate System Change / 3.5 Transformations in OpenGL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in '3.1 Mathematical Foundations'?                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Source cue                  | Vector and Matrix Calculus                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide '3.1 Mathematical Foundations' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Vector and Matrix Calculus. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about 3.1 Mathematical Foundations. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Vector and Matrix Calculus. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you state the coordinate space before and after '3.1 Mathematical Foundations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|            |                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Vertices as Vectors' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Vectors are used to represent geometric objects (coordinates) / - Vectors have real numbers as components, so they are elements of $R^2$ , $R^3$ , $R^4$ / - In computer graphics mostly $R^3$ or $R^4$ vectors used / - Vertices of a polygon are represented as column vectors $x \cdot v$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Vertices as Vectors. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Vectors are used to represent geometric objects (coordinates) / - Vectors have real numbers as components, so they are elements of $R^2$ , $R^3$ , $R^4$ / - In computer graphics mostly $R^3$ or $R^4$ vectors used / - Vertices of a polygon are represented as column vectors $x \cdot v$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | Can you state the coordinate space before and after 'Vertices as Vectors'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Transformations as Matrices' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Matrices are used to represent transformations / - In computer graphics mainly $4 \times 4$ square matrices are used / $a \ b \ c \ d / e \ f \ g \ h / M =$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Technical commentary | This slide is about Transformations as Matrices. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Matrices are used to represent transformations / - In computer graphics mainly $4 \times 4$ square matrices are used / $a \ b \ c \ d / e \ f \ g \ h / M =$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you state the coordinate space before and after 'Transformations as Matrices'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Matrix Vector Multiplication' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Since vectors describe vertices and matrices describe transformations, / transformations can be applied through matrix vector multiplication / - Input: $m \times n$ matrix A and $R_m$ vector B / - Result: $R_n$ vector C, whereby is B transformed through A / - Example for $4 \times 4$ matrix A and $R_4$ vector B. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Matrix Vector Multiplication. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Since vectors describe vertices and matrices describe transformations, / transformations can be applied through matrix vector multiplication / - Input: $m \times n$ matrix A and $R_m$ vector B / - Result: $R_n$ vector C, whereby is B transformed through A / - Example for $4 \times 4$ matrix A and $R_4$ vector B. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you state the coordinate space before and after 'Matrix Vector Multiplication'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide '3.2 Affine Transformations' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Translation, Rotation, Scaling, and more. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                     |
| Technical commentary        | This slide is about 3.2 Affine Transformations. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Translation, Rotation, Scaling, and more. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you state the coordinate space before and after '3.2 Affine Transformations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Page 9                      | Translations - Moving 3D Models                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | - Matrix representation of a translation / $\begin{bmatrix} 1 & 0 & 0 & d \\ 0 & 1 & 0 & d \\ 0 & 0 & 1 & d \\ 0 & 0 & 0 & 1 \end{bmatrix}$ / $T_d$ , $d = [x \ y \ z]^T$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Professor-style explanation | The slide 'Translations - Moving 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Matrix representation of a translation / $\begin{bmatrix} 1 & 0 & 0 & d \\ 0 & 1 & 0 & d \\ 0 & 0 & 1 & d \\ 0 & 0 & 0 & 1 \end{bmatrix}$ / $T_d$ , $d = [x \ y \ z]^T$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Technical commentary | This slide is about Translations - Moving 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Matrix representation of a translation $\begin{bmatrix} 1 & 0 & 0 & d \\ 0 & 1 & 0 & d \\ 0 & 0 & 1 & d \\ 0 & 0 & 0 & 1 \end{bmatrix}$ / $T(d, d, d)$ , $d = x, y, z$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself       | Can you name the geometric objects and attributes represented by 'Translations - Moving 3D Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Translation Properties' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Lengths and angles are preserved / - Identity: $T(0, 0, 0) = I$ (identity matrix) / - Changing order of translations: $T(d_1, d_1, d_1) \cdot T(d_2, d_2, d_2) = T(d_2, d_2, d_2) \cdot T(d_1, d_1, d_1)$ / $x, y, z$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Translation Properties. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Lengths and angles are preserved / - Identity: $T(0, 0, 0) = I$ (identity matrix) / - Changing order of translations: $T(d_1, d_1, d_1) \cdot T(d_2, d_2, d_2) = T(d_2, d_2, d_2) \cdot T(d_1, d_1, d_1)$ / $x, y, z$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you state the coordinate space before and after 'Translation Properties'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'Scaling - Resizing 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Matrix representation of a scaling $\begin{bmatrix} s & 0 & 0 & 0 \\ 0 & s & 0 & 0 \\ 0 & 0 & s & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ , $s, s, s = 1/x, y, z$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Scaling - Resizing 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Matrix representation of a scaling $\begin{bmatrix} s & 0 & 0 & 0 \\ 0 & s & 0 & 0 \\ 0 & 0 & s & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$ , $s, s, s = 1/x, y, z$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Scaling - Resizing 3D Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Scaling Properties' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Lengths are not preserved, angles only for uniform scalings / - Identity: $S(1, 1, 1) = I$ (identity matrix) / - Changing order of scalings: $S(s_1, s_1, s_1) \cdot S(s_2, s_2, s_2) = S(s_2, s_2, s_2) \cdot S(s_1, s_1, s_1)$ / $x, y, z, x, y, z, x, y, z, x, y, z$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Scaling Properties. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Lengths are not preserved, angles only for uniform scalings / - Identity: $S(1, 1, 1) = I$ (identity matrix) / - Changing order of scalings: $S(s_1, s_1, s_1) \cdot S(s_2, s_2, s_2) = S(s_2, s_2, s_2) \cdot S(s_1, s_1, s_1)$ / $x y z x y z x y z x y z$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself       | Can you state the coordinate space before and after 'Scaling Properties'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Source cue                  | - Matrix representation of a rotation around x-, y- and z-axis / $1 \ 0 \ 0 \ 0 / 0 \ \cos \theta \ -\sin \theta \ 0 / R \ \theta = / 0 \ \sin \theta \ \cos \theta \ 0$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Rotation - Changing Orientation of 3D Models 1/2' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Matrix representation of a rotation around x-, y- and z-axis / $1 \ 0 \ 0 \ 0 / 0 \ \cos \theta \ -\sin \theta \ 0 / R \ \theta = / 0 \ \sin \theta \ \cos \theta \ 0$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Rotation - Changing Orientation of 3D Models 1/2. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Matrix representation of a rotation around x-, y- and z-axis / $1 \ 0 \ 0 \ 0 / 0 \ \cos \theta \ -\sin \theta \ 0 / R \ \theta = / 0 \ \sin \theta \ \cos \theta \ 0$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Rotation - Changing Orientation of 3D Models 1/2' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Rotation - Changing Orientation of 3D Models 2/2' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering:</p> <ul style="list-style-type: none"> <li>- Rotations are made in the right-handed coordinate system so that when we / look along a positive axis to the origin, a 90° rotation about that axis / interleaves the positive axes as follows /</li> <li>- Rotation around x-axis transforms +y to +z /</li> <li>- Rotation around y-axis transforms +z to +x.</li> </ul> <p>Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p> |
| Technical commentary        | <p>This slide is about Rotation - Changing Orientation of 3D Models 2/2. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering:</p> <ul style="list-style-type: none"> <li>- Rotations are made in the right-handed coordinate system so that when we / look along a positive axis to the origin, a 90° rotation about that axis / interleaves the positive axes as follows /</li> <li>- Rotation around x-axis transforms +y to +z /</li> <li>- Rotation around y-axis transforms +z to +x.</li> </ul> <p>Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Rotation - Changing Orientation of 3D Models 2/2' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Page 15                     | Rotation Properties                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Professor-style explanation | <p>The slide 'Rotation Properties' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Lengths and angles are preserved / - Identity: <math>R \cdot 0 = R \cdot 0 = R \cdot 0 = I</math> (identity matrix) / x y z / - Changing order of rotations around same axis: / - <math>R(\theta) \cdot R(\phi) = R(\phi) \cdot R(\theta)</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p>  |
| Technical commentary        | <p>This slide is about Rotation Properties. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Lengths and angles are preserved / - Identity: <math>R \cdot 0 = R \cdot 0 = R \cdot 0 = I</math> (identity matrix) / x y z / - Changing order of rotations around same axis: / - <math>R(\theta) \cdot R(\phi) = R(\phi) \cdot R(\theta)</math>. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | <p>The slide 'Mirroring - Reflecting 3D Models on a Plane' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Matrix representation of mirroring along x-y plane / <math>\begin{bmatrix} 1 &amp; 0 &amp; 0 &amp; 0 \\ 0 &amp; 1 &amp; 0 &amp; 0 \\ 0 &amp; 0 &amp; -1 &amp; 0 \end{bmatrix} / M =</math> / <math>\begin{bmatrix} 1 &amp; 0 &amp; 0 &amp; 0 \\ 0 &amp; 1 &amp; 0 &amp; 0 \\ 0 &amp; 0 &amp; -1 &amp; 0 \end{bmatrix}</math>. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Technical commentary | This slide is about Mirroring - Reflecting 3D Models on a Plane. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Matrix representation of mirroring along x-y plane / $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -1 & 0 \end{bmatrix}$ / $M =$ / $\begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -1 & 0 \end{bmatrix}$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you name the geometric objects and attributes represented by 'Mirroring - Reflecting 3D Models on a Plane' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Shearing - Skewing 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Matrix representation of a shearing / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Shearing - Skewing 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Matrix representation of a shearing / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ / $\begin{bmatrix} 1 & h & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix}$ . Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide '3.3 Composition of Transformations' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Concatenation of several transformation steps. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about 3.3 Composition of Transformations. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Concatenation of several transformation steps. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you state the coordinate space before and after '3.3 Composition of Transformations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Page 19                     | Composition of Transformations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Source cue                  | - Composition of transformations $T$ is done / by multiplying the respective transformation matrices / $(T \cdot T \cdot \dots \cdot T \cdot T) \cdot v = (T \cdot (T \cdot (\dots (T \cdot (T \cdot v)))))$ / $1 \ 2 \ n-1 \ n \ 1 \ 2 \ n-1 \ n$ / - Interpretation: apply first transformation $T$ , then $T$ , ..., and finally $T$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Composition of Transformations' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Composition of transformations $T$ is done / by multiplying the respective transformation matrices / $(T \cdot T \cdot \dots \cdot T \cdot T) \cdot v = (T \cdot (T \cdot (\dots (T \cdot (T \cdot v)))))$ / $1 \ 2 \ n-1 \ n \ 1 \ 2 \ n-1 \ n$ / - Interpretation: apply first transformation $T$ , then $T$ , ..., and finally $T$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Composition of Transformations. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Composition of transformations $T$ is done / by multiplying the respective transformation matrices / - $(T \cdot T \cdot \dots \cdot T \cdot T) \cdot v = (T \cdot (T \cdot (\dots \cdot (T \cdot (T \cdot v)))))$ / 1 2 $n-1$ $n$ 1 2 $n-1$ $n$ / - Interpretation: apply first transformation $T$ , then $T$ , ..., and finally $T$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you state the coordinate space before and after 'Composition of Transformations'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Page 20                     | Reference Points 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | - Rotation and scaling happen in relation to origin (reference point)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Professor-style explanation | The slide 'Reference Points 1/2' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Rotation and scaling happen in relation to origin (reference point). The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Reference Points 1/2. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Rotation and scaling happen in relation to origin (reference point). The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you turn 'Reference Points 1/2' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|            |                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'Reference Points 2/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - In order to rotate (or scale) 3D models at an arbitrary reference point, / a sequence of transformations is necessary / - Move the 3D model from reference point M to the origin O / - Rotate (or scale) the 3D model / - Move the 3D model back to M. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Reference Points 2/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - In order to rotate (or scale) 3D models at an arbitrary reference point, / a sequence of transformations is necessary / - Move the 3D model from reference point M to the origin O / - Rotate (or scale) the 3D model / - Move the 3D model back to M. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you state the coordinate space before and after 'Reference Points 2/2'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | <p>The slide 'Rotation Around Arbitrary Axis' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Rotation around any axis / - Axis given by center of rotation P and direction <math>U = (u_x, u_y, u_z)</math> / - Rotation by <math>\theta</math> degrees / - Construction of transformation as transformation sequence. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Rotation Around Arbitrary Axis. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Rotation around any axis / - Axis given by center of rotation P and direction <math>U = (u_x, u_y, u_z)</math> / - Rotation by <math>\theta</math> degrees / - Construction of transformation as transformation sequence. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | <p>Can you state the coordinate space before and after 'Rotation Around Arbitrary Axis'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Reminder: Vector Calculus' explains how a visible surface point receives color from local lighting. The surface normal gives the orientation of the surface. The light vector gives the direction from which illumination arrives. The view vector connects the surface point to the observer, and the material parameters decide how strongly the surface reacts with ambient, diffuse, or specular reflection. The terms describe local shading inputs: - Length of a vector is expressed as follows <math> v  = \sqrt{v_x^2 + v_y^2 + v_z^2}</math> / - Vectors of length <math> v  = 1</math> are normalized and called unit vectors / - Arbitrary vectors can be normalized as follows. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. The object-level relation is light source, surface point, normal, material response, and computed color. The visual behavior changes when any of these objects changes: a rotated normal changes diffuse brightness, a different view vector moves the specular highlight, and different material coefficients change the perceived surface type.</p> |

| Technical commentary | This slide is about Reminder: Vector Calculus. The lighting objects on the slide combine normals, light directions, view directions, material coefficients, and shading locations to compute color. The terms describe local shading inputs: - Length of a vector is expressed as follows $ v  = \sqrt{v_x^2 + v_y^2 + v_z^2}$ / - Vectors of length $ v  = 1$ are normalized and called unit vectors / - Arbitrary vectors can be normalized as follows. Surface position, normal, light direction, view direction, and material response combine to produce the final color contribution. |
| Why it matters       | Lighting formulas are only meaningful when their vectors and material terms are interpreted correctly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you identify the normal, light vector, view vector, and material term relevant to 'Reminder: Vector Calculus'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Reminder: Cross Product (= vector product)' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Given two vectors $u$ and $v$ in $\mathbb{R}^3$ / - Cross product $u \times v$ of $u$ and $v$ is a vector defined as follows $u \times v = \begin{vmatrix} u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = \begin{vmatrix} u_x & u_y \\ v_x & v_y \end{vmatrix} \mathbf{z} - \begin{vmatrix} u_x & u_z \\ v_x & v_z \end{vmatrix} \mathbf{y} + \begin{vmatrix} u_y & u_z \\ v_y & v_z \end{vmatrix} \mathbf{x}$ / $u \times v = -v \times u$ . The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Reminder: Cross Product (= vector product). The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Given two vectors $u$ and $v$ in $\mathbb{R}^3$ / - Cross product $u \times v$ of $u$ and $v$ is a vector defined as follows $u \times v = \begin{vmatrix} u_x & u_y & u_z \\ v_x & v_y & v_z \end{vmatrix} = \begin{vmatrix} u_x & u_y \\ v_x & v_y \end{vmatrix} \mathbf{z} - \begin{vmatrix} u_x & u_z \\ v_x & v_z \end{vmatrix} \mathbf{y} + \begin{vmatrix} u_y & u_z \\ v_y & v_z \end{vmatrix} \mathbf{x}$ / $u \times v = -v \times u$ . The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you turn 'Reminder: Cross Product (= vector product)' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|            |                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Example - Transforming Directed Line Segment 1/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Example transformation task / - Given line segments <math>P</math> and <math>P</math> / 1 2 1 3 / - Transform it into the <math>yz</math>-plane so that <math>P</math> lies on the <math>z</math>-axis / 1 2. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p>                     |
| Technical commentary        | <p>This slide is about Example - Transforming Directed Line Segment 1/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Example transformation task / - Given line segments <math>P</math> and <math>P</math> / 1 2 1 3 / - Transform it into the <math>yz</math>-plane so that <math>P</math> lies on the <math>z</math>-axis / 1 2. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you state the coordinate space before and after 'Example - Transforming Directed Line Segment 1/7'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Page 26                     | Example - Transforming Directed Line Segment 2/7                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | - Approach 1: Determine rotation angles for rotation sequence / - Move $P = x, y, z$ into the origin / 1 1 1 1 / - Rotate around the $y$ -axis so that $P$ lies in the $yz$ -plane / 1 2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | <p>The slide 'Example - Transforming Directed Line Segment 2/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Approach 1: Determine rotation angles for rotation sequence / - Move <math>P = x, y, z</math> into the origin / 1 1 1 1 / - Rotate around the <math>y</math>-axis so that <math>P</math> lies in the <math>yz</math>-plane / 1 2. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |

| Technical commentary | This slide is about Example - Transforming Directed Line Segment 2/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Approach 1: Determine rotation angles for rotation sequence / 1 1 1 / - Move $P = x, y, z$ into the origin / 1 1 1 / - Rotate around the y-axis so that $P$ lies in the yz-plane / 1 2. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | The slide 'Example - Transforming Directed Line Segment 3/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Step 2 - Rotation of $P' P'$ around y-axis into yz-plane / 1 2 / - Rotation $R(\theta - 90^\circ)$ / - Rotation angle - $(90^\circ - \theta) = \theta - 90^\circ$ / - Matrix ingredients. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example - Transforming Directed Line Segment 3/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Step 2 - Rotation of $P' P'$ around y-axis into yz-plane / 1 2 / - Rotation $R(\theta - 90^\circ)$ / - Rotation angle - $(90^\circ - \theta) = \theta - 90^\circ$ / - Matrix ingredients. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Example - Transforming Directed Line Segment 4/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Step 3 - Rotation of $P'' P''$ around x-axis onto z-axis / 1 2 / - Rotation $R(\phi)$ / - Matrix ingredients / $z''$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                             |
| Technical commentary        | This slide is about Example - Transforming Directed Line Segment 4/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Step 3 - Rotation of $P'' P''$ around x-axis onto z-axis / 1 2 / - Rotation $R(\phi)$ / - Matrix ingredients / $z''$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you state the coordinate space before and after 'Example - Transforming Directed Line Segment 4/7'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

The terms describe a coordinate-space conversion: - Step 4 - Rotation of $P''' P'''$ into yz-plane / 1 3 / - Rotation $R(\alpha)$ / $y \blacksquare \blacksquare \blacksquare$ / - Matrix ingredients. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide 'Example - Transforming Directed Line Segment 6/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Approach 2: Construct orthogonal matrix which obeys following properties / - Each row and column corresponds to a unit length vector / - Row and column vectors are orthogonal to each other / - Each row vector rotates on one main axis / (R on x-axis, R on y-axis, R on z-axis). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example - Transforming Directed Line Segment 6/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Approach 2: Construct orthogonal matrix which obeys following properties / - Each row and column corresponds to a unit length vector / - Row and column vectors are orthogonal to each other / - Each row vector rotates on one main axis / (R on x-axis, R on y-axis, R on z-axis). Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you state the coordinate space before and after 'Example - Transforming Directed Line Segment 6/7'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Page 31                     | Example - Transforming Directed Line Segment 7/7                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Source cue                  | - Consideration 2: Formulate R as unit vector / orthogonal to the plane spanned by $P_1, P_2$ , and $P_3$ / $P_1 \times P_2$ / $R = \frac{P_1 \times P_2}{\ P_1 \times P_2\ }$ / $T = \begin{bmatrix} 1 & 3 & 1 & 2 \end{bmatrix}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Example - Transforming Directed Line Segment 7/7' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Consideration 2: Formulate R as unit vector / orthogonal to the plane spanned by $P_1, P_2$ , and $P_3$ / $P_1 \times P_2$ / $R = \frac{P_1 \times P_2}{\ P_1 \times P_2\ }$ / $T = \begin{bmatrix} 1 & 3 & 1 & 2 \end{bmatrix}$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example - Transforming Directed Line Segment 7/7. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Consideration 2: Formulate R as unit vector / orthogonal to the plane spanned by $P_1, P_2$ , and $P_3$ / $P_1 \times P_2$ / $R = \frac{P_1 \times P_2}{\ P_1 \times P_2\ }$ / $T = \begin{bmatrix} 1 & 3 & 1 & 2 \end{bmatrix}$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself              | Can you state the coordinate space before and after 'Example - Transforming Directed Line Segment 7/7'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Example - Direction of Flight Transformation 1/3' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Example transformation task / - Given 3D model centered in origin of $x$ -, $y$ -, $z$ -coordinate system / $p$ $p$ $p$ / - Transform it such that / - it is centered in arbitrary point $P$ , and. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example - Direction of Flight Transformation 1/3. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Example transformation task / - Given 3D model centered in origin of $x$ -, $y$ -, $z$ -coordinate system / $p$ $p$ $p$ / - Transform it such that / - it is centered in arbitrary point $P$ , and. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you state the coordinate space before and after 'Example - Direction of Flight Transformation 1/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Example - Direction of Flight Transformation 2/3' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: $r$ $r$ $r$ / $1x$ $2x$ $3x$ / - Step 1 - create orthogonal rotation matrix $R = r$ $r$ $r$ / $1y$ $2y$ $3y$ / $r$ $r$ $r$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary | This slide is about Example - Direction of Flight Transformation 2/3. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $r \ r \ r / 1x \ 2x \ 3x /$ - Step 1 - create orthogonal rotation matrix $R = r \ r \ r / 1y \ 2y \ 3y / r \ r \ r$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Page 34                     | Example - Direction of Flight Transformation 3/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | - Transformation M is described by a translation and an orthogonal matrix $/ r \ r \ r \ 0 / 1x \ 2x \ 3x / r \ r \ r \ 0 / 1y \ 2y \ 3y$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Professor-style explanation | The slide 'Example - Direction of Flight Transformation 3/3' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Transformation M is described by a translation and an orthogonal matrix $/ r \ r \ r \ 0 / 1x \ 2x \ 3x / r \ r \ r \ 0 / 1y \ 2y \ 3y$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example - Direction of Flight Transformation 3/3. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Transformation M is described by a translation and an orthogonal matrix $/ r \ r \ r \ 0 / 1x \ 2x \ 3x / r \ r \ r \ 0 / 1y \ 2y \ 3y$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you state the coordinate space before and after 'Example - Direction of Flight Transformation 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide '3.4 Coordinate System Change' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: Transformation as change of frame of reference. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about 3.4 Coordinate System Change. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: Transformation as change of frame of reference. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Coordinate System Change' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Alternative view on transformations: / - transformations change the coordinate system of 3D model / Example 1 Example 2. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

| Page 37                     | Local Coordinate Systems                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Source cue                  | - Application in OpenGL / - Individual 3D models of a scene have their own, local coordinate system / - Local coordinate systems of the 3D models must be changed / into a common coordinate system, the world coordinate system / - Transformation between coordinate systems (CS)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Professor-style explanation | The slide 'Local Coordinate Systems' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Application in OpenGL / - Individual 3D models of a scene have their own, local coordinate system / - Local coordinate systems of the 3D models must be changed / into a common coordinate system, the world coordinate system / - Transformation between coordinate systems (CS). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Local Coordinate Systems. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Application in OpenGL / - Individual 3D models of a scene have their own, local coordinate system / - Local coordinate systems of the 3D models must be changed / into a common coordinate system, the world coordinate system / - Transformation between coordinate systems (CS). Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Local Coordinate Systems'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Page 38                     | Example 1 - Coordinate System Change 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | $x(1)$ / - Example transformation task $y(5)$ / - Rotation and scaling of an object around its center $M$ / $y(1)$ / and subsequent translation to a point $Q$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Example 1 - Coordinate System Change 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: $x(1)$ / - Example transformation task $y(5)$ / - Rotation and scaling of an object around its center $M$ / $y(1)$ / and subsequent translation to a point $Q$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example 1 - Coordinate System Change 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $x(1)$ / - Example transformation task $y(5)$ / - Rotation and scaling of an object around its center $M$ / $y(1)$ / and subsequent translation to a point $Q$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you state the coordinate space before and after 'Example 1 - Coordinate System Change 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 39                     | Example 1 - Coordinate System Change 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Example 1 - Coordinate System Change 2/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: $y(5)$ / $y(2)$ $y(3)$ / $x(1)$ / 3D Model Transformation / $y(5)$ / $y(2)$ $y(3)$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.                                                                             |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Technical commentary | This slide is about Example 1 - Coordinate System Change 2/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: $y \ y \ y \ y \ / \ x \ x \ x \ x \ / \ 3D \ Model \ Transformation \ / \ y(5) \ / \ y(2) \ y(3)$ . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Professor-style explanation | The slide 'Example 2 - Hierarchical Coordinate Systems 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - To model complex scenes, a hierarchy of coordinate systems is helpful / - Example: modeling of a tricycle / - World-coordinate system / - Tricycle-coordinate system / - Wheel-coordinate system. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example 2 - Hierarchical Coordinate Systems 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - To model complex scenes, a hierarchy of coordinate systems is helpful / - Example: modeling of a tricycle / - World-coordinate system / - Tricycle-coordinate system / - Wheel-coordinate system. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Example 2 - Hierarchical Coordinate Systems 1/2' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Scene graphs are used to represent hierarchical coordinate systems / and the required transformations / Tricycle Translation T / Steering Rotation R ( $\alpha$ ) / y-tr. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Example 2 - Hierarchical Coordinate Systems 1/2. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Scene graphs are used to represent hierarchical coordinate systems / and the required transformations / Tricycle Translation T / Steering Rotation R ( $\alpha$ ) / y-tr. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Check yourself              | Can you state the coordinate space before and after 'Example 2 - Hierarchical Coordinate Systems 1/2'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Page 42                     | 3.5 Transformations in OpenGL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source cue                  | Implementation with GLM und GLSL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide '3.5 Transformations in OpenGL' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: Implementation with GLM und GLSL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.                                                                                                                                                             |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about 3.5 Transformations in OpenGL. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: Implementation with GLM und GLSL. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in '3.5 Transformations in OpenGL'?                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Geometric Transformations in OpenGL' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Supported coordinate systems / - Floating-point coordinate system for 2D and 3D / - Integer coordinate system (2D) as a special case / - Representation of vectors / - 2D vector by one-dimensional array with 2 elements. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |
| Technical commentary        | This slide is about Geometric Transformations in OpenGL. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Supported coordinate systems / - Floating-point coordinate system for 2D and 3D / - Integer coordinate system (2D) as a special case / - Representation of vectors / - 2D vector by one-dimensional array with 2 elements. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'Geometric Transformations in OpenGL'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Page 44                     | OpenGL Transformation Pipeline                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | <p>The slide 'OpenGL Transformation Pipeline' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: - Model-View matrix / - Transformation matrix for model space related transformations / - Additionally contains the transformation of the scene / into the camera coordinate system (view transformation, not projection!) / - Transformation pipeline. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image.</p> |
| Technical commentary        | <p>This slide is about OpenGL Transformation Pipeline. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: - Model-View matrix / - Transformation matrix for model space related transformations / - Additionally contains the transformation of the scene / into the camera coordinate system (view transformation, not projection!) / - Transformation pipeline. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Why it matters              | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Check yourself              | Can you name the OpenGL object, state, shader stage, or buffer involved in 'OpenGL Transformation Pipeline'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 45                     | Example - Translation and Scaling                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | <ul style="list-style-type: none"> <li>- Drawing cylinder objects / - drawCylinder draws a cylinder centered at the origin, / with respect to the y-axis, with a given radius and height / - By translation this "unit cylinder" can be positioned / - By scaling this "unit cylinder" can be resized</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Professor-style explanation | The slide 'Example - Translation and Scaling' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Drawing cylinder objects / - drawCylinder draws a cylinder centered at the origin, / with respect to the y-axis, with a given radius and height / - By translation this "unit cylinder" can be positioned / - By scaling this "unit cylinder" can be resized. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about Example - Translation and Scaling. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Drawing cylinder objects / - drawCylinder draws a cylinder centered at the origin, / with respect to the y-axis, with a given radius and height / - By translation this "unit cylinder" can be positioned / - By scaling this "unit cylinder" can be resized. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you turn 'Example - Translation and Scaling' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Page 46                     | Matrix Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Source cue                  | - Matrices are often specified in form of a C array / void draw(...) { / ... / GLfloat M[4][4]; / M[0][0] = ....;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Professor-style explanation | The slide 'Matrix Specification' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Matrices are often specified in form of a C array / void draw(...) { / ... / GLfloat M[4][4]; / M[0][0] = . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Technical commentary | This slide is about Matrix Specification. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Matrices are often specified in form of a C array / void draw(...) { / ... / GLfloat M[4][4]; / M[0][0] = . Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. |
| Why it matters       | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself       | Can you state the coordinate space before and after 'Matrix Specification'?                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Page 47                     | Example - Portico Modeling 1/5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Source cue                  | - Columned hall consists of floor space, H·0.1 / top surface and columns /<br>- Columns are evenly distributed / along the edge of the round floor surface H /<br>- Total height of a column is H,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Example - Portico Modeling 1/5' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Columned hall consists of floor space, H·0.1 / top surface and columns /<br>- Columns are evenly distributed / along the edge of the round floor surface H /<br>- Total height of a column is H,. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Example - Portico Modeling 1/5. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Columned hall consists of floor space, H·0.1 / top surface and columns /<br>- Columns are evenly distributed / along the edge of the round floor surface H /<br>- Total height of a column is H,. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Example - Portico Modeling 1/5' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Example - Portico Modeling 3/5' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Drawing a single column / - Composition of 5 cylinder objects / - Rotation into y-axis to match orientation / - Positioning of the parts by translation along the y-axis / - Incremental translation around the partial column height. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Example - Portico Modeling 3/5. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Drawing a single column / - Composition of 5 cylinder objects / - Rotation into y-axis to match orientation / - Positioning of the parts by translation along the y-axis / - Incremental translation around the partial column height. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Example - Portico Modeling 3/5' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 50                     | Example - Portico Modeling 4/5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | The slide 'Example - Portico Modeling 4/5' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Drawing the group of columns / - Columns are evenly distributed on a circle with radius R / - Number N, radius R of the columns as well as floor radius R adjustable. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors.                                                                  |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Technical commentary | This slide is about Example - Portico Modeling 4/5. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Drawing the group of columns / - Columns are evenly distributed on a circle with radius R / - Number N, radius R of the columns as well as floor radius R adjustable. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you name the geometric objects and attributes represented by 'Example - Portico Modeling 4/5' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Source cue                  | - Drawing the hall / - Use cylinder primitive as floor area / - Use cone primitive as a roof                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Professor-style explanation | The slide 'Example - Portico Modeling 5/5' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Drawing the hall / - Use cylinder primitive as floor area / - Use cone primitive as a roof. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Example - Portico Modeling 5/5. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Drawing the hall / - Use cylinder primitive as floor area / - Use cone primitive as a roof. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Example - Portico Modeling 5/5' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | <p>The slide 'by applying affine transformations to their vertices' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - 3D models can be positioned, resized and oriented in the 3D world / by applying affine transformations to their vertices / - An affine transformation is represented by a 4x4 matrix / - Affine transformations can be more efficiently applied / when concatenated to a single matrix through matrix multiplication. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about by applying affine transformations to their vertices. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - 3D models can be positioned, resized and oriented in the 3D world / by applying affine transformations to their vertices / - An affine transformation is represented by a 4x4 matrix / - Affine transformations can be more efficiently applied / when concatenated to a single matrix through matrix multiplication. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | <p>Can you state the coordinate space before and after 'by applying affine transformations to their vertices'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 53                     | <p>Literature and other sources used in this chapter</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Source cue                  | <p>No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Professor-style explanation | <p>The slide 'Literature and other sources used in this chapter' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Technical commentary        | This slide is about Literature and other sources used in this chapter. The slide lists source material or chapter references that support the technical content and give names for further reading. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Reference slides provide the source trail for definitions, algorithms, and deeper explanations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you identify which source or topic 'Literature and other sources used in this chapter' points to for deeper study?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 54                     | (3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Source cue                  | - Text Books / - J. Foley, A. van Dam, S. Feiner: Computer Graphics: Principles and Practice / (3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11) / - P. Shirley, M. Ashikhmin, S. | Professor-style explanation | The slide '(3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11)' introduces a graphics object, operation, or relation that belongs to the rendering workflow. The named terms describe what data enters the step, what operation changes or classifies that data, and what result is passed onward. The terms form an input-operation-output relation: - Text Books / - J. Foley, A. van Dam, S. Feiner: Computer Graphics: Principles and Practice / (3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11) / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer. The slide groups them because one object or quantity is processed into another result used later in rendering. The object-level relation is input, operation, output, and later use. This is the basic shape of most computer graphics concepts: data is represented in one form, processed by a rule or algorithm, and then consumed by the next stage of image generation. |
| Technical commentary        | This slide is about (3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11). The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The terms form an input-operation-output relation: - Text Books / - J. Foley, A. van Dam, S. Feiner: Computer Graphics: Principles and Practice / (3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11) / - P. Shirley, M. Ashikhmin, S. Marschner: Fundamentals of Computer. The slide groups them because one object or quantity is processed into another result used later in rendering.                                                                                                                                                                                                                                                                                                                                                            |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn '(3rd Edition), Addison-Wesley 2013. (Chapters 10 & 11)' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## 03.1 Mathematical Foundations

Source location: Section 3.1

### Commentary

The lecture uses vectors and matrices to express geometric operations. A vector can represent a point position, a direction, an offset, or an attribute depending on context. A matrix expresses a linear map or, with homogeneous coordinates, an affine transformation.

The central exam habit is to name the coordinate space. A point in model coordinates and a light direction in view coordinates cannot be mixed safely. Many visual bugs are coordinate-space bugs.

## Mental model

A numeric vector is incomplete until you know what coordinate system it belongs to.

## Check yourself

Why is a normal vector not transformed exactly like a point under all transformations?

# 03.2 Affine Transformations

Source location: Section 3.2

## Commentary

Affine transformations include translation, rotation, scaling, shearing, and combinations of these. Homogeneous coordinates allow translation to be represented in matrix form together with other transformations.

Translation moves positions but not pure directions. Rotation changes orientation while preserving lengths if it is a proper rotation. Scaling can change lengths and can also affect normals. These distinctions matter later in lighting.

## Mental model

Use 4D homogeneous coordinates so that a single matrix pipeline can move 3D points through the scene.

## Check yourself

What does the homogeneous  $w$  component let a transformation matrix express?

# 03.3 Composition of Transformations

Source location: Section 3.3

## Commentary

Composition means applying several transformations in sequence. The order matters because matrix multiplication is generally not commutative. Rotating an object around its own origin and then translating it is different from translating it and then rotating around the world origin.

When you read a formula such as  $\text{projection} * \text{view} * \text{model} * \text{position}$ , read it from right to left for the point: first model, then view, then projection. The resulting matrix chain is compact, but the conceptual steps remain separate.

## Mental model

Matrix chains are compressed stories of movement through coordinate spaces.

## Check yourself

Why can swapping model and view matrices destroy the intended camera/object relation?

## 03.4 Coordinate System Change

Source location: Section 3.4

### Commentary

A transformation can be read actively as moving an object, or passively as changing the coordinate frame used to describe it. Both interpretations are valid, but mixing them carelessly causes sign and order errors.

The view matrix is a classic example: conceptually you position a camera, but the pipeline usually transforms the world by the inverse of the camera transform so that the camera becomes the origin of view space.

### Mental model

Moving the camera one way is equivalent to moving the world the opposite way for rendering.

## Check yourself

Why is the view transform often related to the inverse camera transform?

## 03.5 Transformations in OpenGL

Source location: Section 3.5

### Commentary

Modern OpenGL does not automatically manage the old matrix stacks. You usually compute model, view, and projection matrices in application code and pass them to shaders as uniforms.

The vertex shader is where the final clip-space position is normally computed. That means a wrong matrix uniform, wrong multiplication order, or wrong convention can make geometry vanish even though buffers and draw calls are correct.

### Mental model

The shader is the place where abstract transformation math becomes GPU execution.

## Check yourself

Which matrix would you inspect first if an object follows the camera instead of staying in the world?

## End-of-lecture summary

If you remember only one thing from Lecture 03, remember this: This lecture explains how geometry moves between coordinate systems. Almost every later topic assumes that you can track where a point or vector currently lives.

Before moving on, you should be able to explain the lecture without reading slide bullets aloud. Use the vocabulary from the slides, but add causal links: why a step exists, what data it consumes, what it produces, and what can go wrong.

# Lecture 04 - Geometric Projection

This lecture explains how a 3D view becomes a 2D image. Projection is where camera geometry, homogeneous coordinates, clipping planes, depth precision, and viewport mapping meet.

## How to read this lecture

- Read the section commentary before looking at the raw slide bullets.
- Use the mental model as the short version you should remember.
- Answer the check question without notes before continuing.

## Per-slide commentary

Each extracted slide page gets its own note. Use this section as the spoken commentary that the terse slide deck is missing.

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Page 1                      | Visual or title slide                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | No object-level text was extracted from this page; the page is primarily title, image, diagram, or layout content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Professor-style explanation | The slide 'Visual or title slide' is primarily a visual, title, transition, or diagram page rather than a text-heavy concept slide. Its role is to place the next concept into the lecture flow and give a visual anchor for the topic that follows. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text. In the surrounding lecture sequence, this kind of page usually marks a shift of attention: from one pipeline stage to another, from a general idea to an algorithm, or from theory to an implementation detail. |
| Technical commentary        | This slide is about Visual or title slide. The slide names a concrete relation between input data, an operation, and an output that another graphics stage can consume. The extracted text does not expose object-level labels for this page. Within the lecture flow, the page functions as a visual, diagram, or title transition, so its connection is established by the surrounding slides rather than by readable bullet text.                                                                                                                                                                                                                                                                                              |
| Why it matters              | Even a sparse slide usually names a relation you must be able to explain in words.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | Can you turn 'Visual or title slide' into a causal sentence instead of repeating the slide title?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Page 2                      | Projecting 3D Models                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Professor-style explanation | The slide 'Projecting 3D Models' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - To compute the 2D representation of a 3D model on the screen, / it needs to be projected, whereby it loses its z-coordinates / - Depending on the projection type, the object might get skewed / (perspective shortening) / - Projection can also be expressed as a matrix multiplication,. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Projecting 3D Models. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - To compute the 2D representation of a 3D model on the screen, / it needs to be projected, whereby it loses its z-coordinates / - Depending on the projection type, the object might get skewed / (perspective shortening) / - Projection can also be expressed as a matrix multiplication,. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Projecting 3D Models' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide '4.1 Linear Perspective' explains how OpenGL exposes the rendering pipeline through explicit objects and state. A context owns the current rendering state; buffers hold vertex, index, texture, or pixel data; shader programs define programmable processing; textures and samplers provide sampled data; framebuffers receive the result. OpenGL does not render from intention, it renders from the objects that are bound and the state that is active at the moment of the draw call. The terms connect CPU-side API control with GPU execution: 4.2 Planar Projections / 4.3 Camera Modeling / 4.4 Specifying Projections in OpenGL / 4.5 Perspective Projection Derivation / 4.6 Orthographic Projection Derivation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. The concrete relation is API command, GPU resource, shader interface, and visible result. A small mismatch in this relation, such as a wrong buffer layout, missing uniform, wrong texture unit, or disabled depth test, can produce a perfectly valid draw call with a completely wrong image. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Technical commentary | This slide is about 4.1 Linear Perspective. The OpenGL objects and calls shown here control GPU state, bound resources, shader interfaces, buffer contents, or framebuffer access at draw time. The terms connect CPU-side API control with GPU execution: 4.2 Planar Projections / 4.3 Camera Modeling / 4.4 Specifying Projections in OpenGL / 4.5 Perspective Projection Derivation / 4.6 Orthographic Projection Derivation. Objects, bindings, shader interfaces, buffers, and framebuffer state determine what data is processed and where results are written. |
| Why it matters       | OpenGL bugs are usually state, binding, shader-interface, or buffer-layout bugs, so API details matter.                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself       | Can you name the OpenGL object, state, shader stage, or buffer involved in '4.1 Linear Perspective'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Source cue                  | Discovery of perspective distortion in art                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Professor-style explanation | The slide '4.1 Linear Perspective' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: Discovery of perspective distortion in art. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about 4.1 Linear Perspective. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: Discovery of perspective distortion in art. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Check yourself              | Can you explain how '4.1 Linear Perspective' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | <p>The slide 'Linear Perspective' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - What is wrong in this image? / William Hogarth: / False Perspective, 1754 / Satire on False Perspective / William Hogarth (1753). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Linear Perspective. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - What is wrong in this image? / William Hogarth: / False Perspective, 1754 / Satire on False Perspective / William Hogarth (1753). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | <p>Can you explain how 'Linear Perspective' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Page 6                      | Drawing by Projecting                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Drawing by Projecting' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Projection: method for imaging objects using parallel or central beams / - Perspective: / "The science which teaches how to represent tri-dimensional objects / on a bi-dimensional surface, so that the perspective image coincides with / the one which is given by direct vision.". View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Drawing by Projecting. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Projection: method for imaging objects using parallel or central beams / - Perspective: / "The science which teaches how to represent tri-dimensional objects / on a bi-dimensional surface, so that the perspective image coincides with / the one which is given by direct vision.". View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Check yourself              | <p>Can you explain how 'Drawing by Projecting' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Projection in the Arts 1/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Before the Renaissance, pictures often had a religious / and symbolic character / - Perspective was not understood: / accordingly, they seem 2-dimensional / Fresco from an Egyptian grave. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection in the Arts 1/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Before the Renaissance, pictures often had a religious / and symbolic character / - Perspective was not understood: / accordingly, they seem 2-dimensional / Fresco from an Egyptian grave. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you explain how 'Projection in the Arts 1/5' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Professor-style explanation | The slide 'Projection in the Arts 2/5' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: - Techniques to simulate space: / - Shaded round volumetric shapes / - Spatial depth through converging lines / Giotto di Bondone / (1266-1337, Florence). Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Technical commentary | This slide is about Projection in the Arts 2/5. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: - Techniques to simulate space: / - Shaded round volumetric shapes / - Spatial depth through converging lines / Giotto di Bondone / (1266-1337, Florence). Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. |
| Why it matters       | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself       | Can you decide whether 'Projection in the Arts 2/5' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Projection in the Arts 3/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Renaissance (1400-1700) / - New emphasis on the importance of personal views and interpretation of / the world, power of observation, especially of nature / (astronomy, anatomy, botany, ...) / - Universe as a clockwork. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection in the Arts 3/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Renaissance (1400-1700) / - New emphasis on the importance of personal views and interpretation of / the world, power of observation, especially of nature / (astronomy, anatomy, botany, ...) / - Universe as a clockwork. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you explain how 'Projection in the Arts 3/5' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Source cue                  | - Examples from the Renaissance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Projection in the Arts 4/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Examples from the Renaissance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.                                              |
| Technical commentary        | This slide is about Projection in the Arts 4/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Examples from the Renaissance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you explain how 'Projection in the Arts 4/5' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Page 11                     | Projection in the Arts 4/5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Projection in the Arts 4/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Examples from the Renaissance / The Last Supper / Leonardo da Vinci (1498). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Projection in the Arts 4/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Examples from the Renaissance / The Last Supper / Leonardo da Vinci (1498). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. |
| Why it matters       | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself       | Can you explain how 'Projection in the Arts 4/5' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide 'Projection in the Arts 5/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - "The Invention of the Painting" (1830) by Karl Friedrich Schinkel (1781-1841): / - An image based on a legend by Pliny the Elder / - Tracing the shadow contours on a drawing surface. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection in the Arts 5/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - "The Invention of the Painting" (1830) by Karl Friedrich Schinkel (1781-1841): / - An image based on a legend by Pliny the Elder / - Tracing the shadow contours on a drawing surface. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself              | Can you explain how 'Projection in the Arts 5/5' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Professor-style explanation | The slide 'Projection in the Arts 6/5' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - M. C. Escher (1898 - 1972). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection in the Arts 6/5. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - M. C. Escher (1898 - 1972). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Source cue                  | - Filippo Brunelleschi (1377-1446): / Systematic method for obtaining / a perspective projection                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Projection Technics 1/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Filippo Brunelleschi (1377-1446): / Systematic method for obtaining / a perspective projection. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Source cue                  | The Delivery of the Keys / Perugino (1482)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Professor-style explanation | The slide 'Projection Technics 1/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: The Delivery of the Keys / Perugino (1482). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection Technics 1/3. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: The Delivery of the Keys / Perugino (1482). View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Professor-style explanation | <p>The slide 'Projection Technics 2/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by <math>w</math> creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Formal description of the perspective projection / - Leone Batista Alberti (1404-1472): / First essay on the subject of "La Pittura" (1435) / - "A painting [the projection plane] is the intersection of a visual pyramid [view / frustum] at a given distance, with a fixed center [center of projection] and a. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Projection Technics 2/3. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Formal description of the perspective projection / - Leone Batista Alberti (1404-1472): / First essay on the subject of "La Pittura" (1435) / - "A painting [the projection plane] is the intersection of a visual pyramid [view / frustum] at a given distance, with a fixed center [center of projection] and a. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Check yourself              | <p>Can you explain how 'Projection Technics 2/3' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Projection Technics 3/3' explains the moment where continuous geometry becomes a discrete image problem. A mathematical line or triangle is not made of pixels, but the screen is a grid of samples. Rasterization decides which samples are covered by the projected primitive and creates fragments for those samples. At the same time, values attached to the primitive, such as depth, color, normals, or texture coordinates, are interpolated so that each fragment has the data needed for shading. The terms describe sample generation: - Albrecht Dürer (1471-1528): / Geometric and mechanical / description of the concept / of similar triangles / - Construction of several. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments. The important distinction is that rasterization creates candidates. A fragment exists because a primitive covered a sample, but final visibility still depends on depth testing, stencil testing, blending, masking, and framebuffer operations.</p> |
| Technical commentary        | <p>This slide is about Projection Technics 3/3. The rasterization objects on the slide convert ideal geometric primitives into covered samples or fragments with interpolated attributes. The terms describe sample generation: - Albrecht Dürer (1471-1528): / Geometric and mechanical / description of the concept / of similar triangles / - Construction of several. A continuous primitive is tested against the pixel grid, covered samples become fragments, and interpolated attributes travel with those fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | <p>Rasterization determines fragment generation; without it, shading and fragment tests have nothing to operate on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | <p>Can you explain which samples/fragments are generated by 'Projection Technics 3/3'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Source cue                  | - Camera Obscura                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Professor-style explanation | <p>The slide 'Projection Technics 3/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Camera Obscura. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Technical commentary | This slide is about Projection Technics 3/3. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Camera Obscura. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. |
| Why it matters       | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                      |
| Check yourself       | Can you explain how 'Projection Technics 3/3' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                  |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Professor-style explanation | The slide '4.2 Planar Projections' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: Perspective and parallel projections. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about 4.2 Planar Projections. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: Perspective and parallel projections. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Check yourself              | Can you explain how '4.2 Planar Projections' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | <p>The slide 'Geometric Projections' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping:</p> <ul style="list-style-type: none"> <li>- Method of mapping objects onto a screen using projectors</li> <li>- Planar geometric projections</li> <li>- Projection beams are straight lines</li> <li>- Projection surface is a plane (image plane, picture plane, . View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</li> </ul> |
| Technical commentary        | <p>This slide is about Geometric Projections. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping:</p> <ul style="list-style-type: none"> <li>- Method of mapping objects onto a screen using projectors</li> <li>- Planar geometric projections</li> <li>- Projection beams are straight lines</li> <li>- Projection surface is a plane (image plane, picture plane, . View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you explain how 'Geometric Projections' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Page 21                     | Projection Types 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Projection Types 1/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Perspective projection (= central projection) / - Established by projection center / (COP, center of projection) / - Perspective reduction: The size of the projection / of an object decreases with increasing distance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes.</p> |
| Technical commentary        | <p>This slide is about Projection Types 1/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Perspective projection (= central projection) / - Established by projection center / (COP, center of projection) / - Perspective reduction: The size of the projection / of an object decreases with increasing distance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | <p>Projection controls both image composition and depth precision, so it affects visibility and rasterization later.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Check yourself              | <p>Can you explain how 'Projection Types 1/2' changes positions before rasterization?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Professor-style explanation | The slide 'Projection Types 2/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: Planar geometric Projections / Parallel Perspective / Orthographic Oblique 1-Point / 2-Point / Top Axonometric. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Projection Types 2/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: Planar geometric Projections / Parallel Perspective / Orthographic Oblique 1-Point / 2-Point / Top Axonometric. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you explain how 'Projection Types 2/2' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Professor-style explanation | The slide 'Orthographic Projections' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Orthographic projections often used for / construction drawings of machines and parts / - Main views: Front view, top view and side view / - Advantages / - Accurate length and angle measurements possible. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Technical commentary | This slide is about Orthographic Projections. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Orthographic projections often used for / construction drawings of machines and parts / - Main views: Front view, top view and side view / - Advantages / - Accurate length and angle measurements possible. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. |
| Why it matters       | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Check yourself       | Can you explain how 'Orthographic Projections' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Professor-style explanation | The slide 'Axonometric Projections' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Projection beams perpendicular to the projection plane / Isometric / - Projection plane not perpendicular to a coordinate axis / - Visible effects / - Several perpendicular surfaces visible. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Axonometric Projections. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Projection beams perpendicular to the projection plane / Isometric / - Projection plane not perpendicular to a coordinate axis / - Visible effects / - Several perpendicular surfaces visible. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Check yourself              | Can you state the coordinate space before and after 'Axonometric Projections'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Source cue                  | - Applications in illustrations, furniture design, ... / - Advantages / - Communicate spatial impression in a single view / - Same length ratios along the main axes / - Disadvantages                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Professor-style explanation | The slide 'Isometric Projections' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Applications in illustrations, furniture design, ... / - Advantages / - Communicate spatial impression in a single view / - Same length ratios along the main axes / - Disadvantages. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Isometric Projections. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Applications in illustrations, furniture design, ... / - Advantages / - Communicate spatial impression in a single view / - Same length ratios along the main axes / - Disadvantages. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you explain how 'Isometric Projections' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Page 26                     | Oblique Projection 1/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source cue                  | - Projection rays not perpendicular to the projection plane / - Common: $\alpha = 30^\circ$ / - Cavalier projection $\alpha = 45^\circ$ , i.e., $\tan(\alpha) = 1$ / a' projectors                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Professor-style explanation | The slide 'Oblique Projection 1/2' explains the problem of deciding which surface is actually visible from the current viewpoint. Many primitives can project to the same image region, but only the nearest relevant surface should determine the opaque color at a pixel. Different algorithms solve this relation in different spaces: object-space methods sort or split geometry, image-space methods subdivide regions, ray methods query visibility along viewing rays, and the depth buffer compares per-fragment depth values. The terms describe an occlusion test: - Projection rays not perpendicular to the projection plane / - Common: $\alpha = 30^\circ$ / - Cavalier projection $\alpha = 45^\circ$ , i.e., $\tan(\alpha) = 1$ / $a'$ projectors. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint. The object-level relation is viewpoint, candidate surface, visibility rule, and visible result. This relation is the reason that fragment generation and final pixel color are not the same thing.                                                                                                                                                                                             |
| Technical commentary        | This slide is about Oblique Projection 1/2. The visibility method on the slide decides which surface, fragment, ray hit, or image region is visible from the current viewpoint. The terms describe an occlusion test: - Projection rays not perpendicular to the projection plane / - Common: $\alpha = 30^\circ$ / - Cavalier projection $\alpha = 45^\circ$ , i.e., $\tan(\alpha) = 1$ / $a'$ projectors. Candidate surfaces or ray hits are compared so the renderer can decide which object is actually visible from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Why it matters              | Visibility decides which generated candidates are actually seen from the current viewpoint.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Check yourself              | Can you decide whether 'Oblique Projection 1/2' works per object, per image region, per ray, or per fragment?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Page 27                     | Oblique Projection 2/2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Oblique Projection 2/2' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Advantages / - Can accurately represent the shape of a boundary surface / of an object for accurate measurements / - Missing foreshortening simplifies comparison of sizes / - Gives a good impression of the 3D appearance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Technical commentary | This slide is about Oblique Projection 2/2. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Advantages / - Can accurately represent the shape of a boundary surface / of an object for accurate measurements / - Missing foreshortening simplifies comparison of sizes / - Gives a good impression of the 3D appearance. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. |
| Why it matters       | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Check yourself       | Can you explain how 'Oblique Projection 2/2' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Page 28                     | Properties of Parallel Projections                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Source cue                  | - Assumption: Object surface of greatest interest lies parallel to a main plane / - Direction of projection: DOP (direction of projection) / - Normal of the projection plane: VPN (view plane normal) / - Top view (orthographic) / - VPN    Main axis, DOP    VPN                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Professor-style explanation | The slide 'Properties of Parallel Projections' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Assumption: Object surface of greatest interest lies parallel to a main plane / - Direction of projection: DOP (direction of projection) / - Normal of the projection plane: VPN (view plane normal) / - Top view (orthographic) / - VPN    Main axis, DOP    VPN. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Properties of Parallel Projections. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Assumption: Object surface of greatest interest lies parallel to a main plane / - Direction of projection: DOP (direction of projection) / - Normal of the projection plane: VPN (view plane normal) / - Top view (orthographic) / - VPN    Main axis, DOP    VPN. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Check yourself              | Can you explain how 'Properties of Parallel Projections' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Page 29                     | Perspective Projections 1/3                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Source cue                  | - Properties / - Communicate realistic views of three-dimensional objects / and give a spatial impression / - Distort objects in perspective view / - Scaling of objects is lost                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Professor-style explanation | The slide 'Perspective Projections 1/3' explains how camera geometry turns a 3D scene into image coordinates. In view space, objects are described relative to the camera. The projection matrix then maps that camera-centered geometry into clip space, where the viewing volume and clipping boundaries can be handled consistently. Perspective projection uses the homogeneous coordinate so that the later divide by w creates foreshortening: farther objects occupy less image space. Orthographic projection removes that depth-based size change and keeps parallel structures visually parallel. The terms describe camera-to-screen mapping: - Properties / - Communicate realistic views of three-dimensional objects / and give a spatial impression / - Distort objects in perspective view / - Scaling of objects is lost. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport. The object chain is view-space position, projection matrix, clip coordinate, normalized device coordinate, and viewport coordinate. The slide is therefore connecting camera setup, visual appearance, and the numeric coordinate pipeline that rasterization later consumes. |
| Technical commentary        | This slide is about Perspective Projections 1/3. The projection objects on the slide convert view-space geometry into clip coordinates, normalized coordinates, and finally screen-related positions. The terms describe camera-to-screen mapping: - Properties / - Communicate realistic views of three-dimensional objects / and give a spatial impression / - Distort objects in perspective view / - Scaling of objects is lost. View-space geometry is mapped by a projection matrix, clipped, divided into normalized coordinates, and finally mapped to a viewport.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Why it matters              | Projection controls both image composition and depth precision, so it affects visibility and rasterization later.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Check yourself              | Can you explain how 'Perspective Projections 1/3' changes positions before rasterization?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| Professor-style explanation | <p>The slide 'Perspective Projections 2/3' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - Vanishing points / - For rectangular objects (e.g., axis parallel cubes) whose surface normals / are parallel to the x-, y-, or z-axis, the number of vanishing points is equal / to the number of coordinate axes intersected by the projection plane / 1-Point Perspective 2-Point Perspective 3-Point Perspective. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear.</p> |
| Technical commentary        | <p>This slide is about Perspective Projections 2/3. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - Vanishing points / - For rectangular objects (e.g., axis parallel cubes) whose surface normals / are parallel to the x-, y-, or z-axis, the number of vanishing points is equal / to the number of coordinate axes intersected by the projection plane / 1-Point Perspective 2-Point Perspective 3-Point Perspective. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | <p>A wrong coordinate-space assumption can make correct formulas produce wrong images.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Check yourself              | <p>Can you state the coordinate space before and after 'Perspective Projections 2/3'?</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'Perspective Projections 3/3' explains how geometric objects move through coordinate systems. A point has a location, a vector has a direction and magnitude, a normal describes surface orientation, and a coordinate frame defines how these quantities are measured. A transformation matrix changes the description of these objects: translation moves points, rotation changes orientation, scaling changes size, and composition combines several operations into one matrix product. The terms describe a coordinate-space conversion: - What happens if the cube is rotated so that its surface normals are not / parallel to the coordinate axes? / - Although the projection plane intersects only one coordinate axis, in this case / you get 3 vanishing points. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space. The central relation is source space, transformation, and target space. In computer graphics this relation is everywhere: object space becomes world space, world space becomes view space, and view space becomes clip space. A formula is only meaningful after the two coordinate spaces around it are clear. |
| Technical commentary        | This slide is about Perspective Projections 3/3. The transformation objects on the slide move points, vectors, or coordinate frames from one space into another using matrices or affine operations. The terms describe a coordinate-space conversion: - What happens if the cube is rotated so that its surface normals are not / parallel to the coordinate axes? / - Although the projection plane intersects only one coordinate axis, in this case / you get 3 vanishing points. Input positions or vectors are transformed by matrices so the same object can be expressed in model, world, view, or clip space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Why it matters              | A wrong coordinate-space assumption can make correct formulas produce wrong images.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you state the coordinate space before and after 'Perspective Projections 3/3'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Professor-style explanation | The slide '4.3 Camera Modeling' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: Orientation of the camera and definition of the view volume. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |

| Technical commentary | This slide is about 4.3 Camera Modeling. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: Orientation of the camera and definition of the view volume. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. |
| Why it matters       | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself       | Can you name the geometric objects and attributes represented by '4.3 Camera Modeling' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                               |

| Page 33                     | Camera Modeling                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source cue                  | - Application of planar geometric projections, represented by $4 \times 4$ matrices, / to project a 3D scene onto a projection screen, i.e., the canvas / - Basic camera parameters / - Camera position / - Camera orientation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Professor-style explanation | The slide 'Camera Modeling' explains how scene objects exist before they are rendered. A 3D model is not an image yet; it is a structured description of geometry and attributes. The central objects are vertices, edges, faces, triangles or other primitives, and sometimes additional data such as normals, texture coordinates, colors, materials, or connectivity. The terms describe model representation before rendering: - Application of planar geometric projections, represented by $4 \times 4$ matrices, / to project a 3D scene onto a projection screen, i.e., the canvas / - Basic camera parameters / - Camera position / - Camera orientation. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation. This matters because the rendering pipeline needs this representation as input. The model describes what exists in the scene, while later stages decide where it appears, which parts are visible, how it is sampled into fragments, and how it is shaded into final pixel colors. |
| Technical commentary        | This slide is about Camera Modeling. The slide describes scene objects before rendering: geometric models, primitives, vertices, topology, attributes, and the representation used as input to the pipeline. The terms describe model representation before rendering: - Application of planar geometric projections, represented by $4 \times 4$ matrices, / to project a 3D scene onto a projection screen, i.e., the canvas / - Basic camera parameters / - Camera position / - Camera orientation. Geometric primitives define shape, vertices provide positions and attributes, and later pipeline stages transform, project, rasterize, and shade that representation.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Why it matters              | Model slides explain the input objects that later transformations, projection, rasterization, and shading operate on.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Check yourself              | Can you name the geometric objects and attributes represented by 'Camera Modeling' before rendering begins?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Professor-style explanation | The slide 'View Volume' explains clipping as a geometric boundary operation. A line segment, polygon, or triangle is compared with a window, plane, or volume. The part inside the valid region survives, the part outside is removed, and a primitive crossing the boundary receives newly computed intersection points. The terms describe boundary decisions: - Objects that are within the view volume are visible for the camera / - Conical viewing volume / - Clipping the scene objects against a conical viewing volume is expensive / (solving quadratic equations) / - Frustum - rectangular viewing volume. A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary. The objects involved are the original primitive, the clipping boundary, an inside/outside classification, intersection points, and the resulting clipped primitive. The core idea is not simply deleting geometry; clipping can reshape geometry so that the rasterizer receives only the meaningful visible portion. |
| Technical commentary        | This slide is about View Volume. The clipping objects on the slide classify geometry against boundaries and produce accepted, rejected, or newly intersected primitive pieces. The terms describe boundary decisions: - Objects that are within the view volume are visible for the camera / - Conical viewing volume / - Clipping the scene objects against a conical viewing volume is expensive / (solving quadratic equations) / - Frustum - rectangular viewing volume. A primitive is classified against a clipping region, rejected if outside, preserved if inside, or cut at intersections if it crosses a boundary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Why it matters              | Clipping decides what geometry is allowed to reach rasterization and can create new boundary vertices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Check yourself              | Can you decide what is accepted, rejected, or newly intersected in 'View Volume'?                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Page 35                     | Projection Specification                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
